// 28.7.6.22, spherical Neumann functions;
// spherical Bessel functions of the second kind
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);

}
all such arguments, where arguments of integer type are considered to have the same floating-point conversion rank as `double`. If no such floating-point type with the greatest rank and subrank exists, then overload resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.

An invocation of `nexttoward` is ill-formed if the argument corresponding to the `floating-point-type` parameter has extended floating-point type.

See also: ISO C 7.12

### 28.7.2 Absolute values

```cpp
constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);
```

**Effects**: These functions have the semantics specified in the C standard library for the functions `abs`, `labs`, and `llabs`, respectively.

**Remarks**: If `abs` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

See also: ISO C 7.12.7.2, 7.22.6.1

### 28.7.3 Three-dimensional hypotenuse

```cpp
constexpr floating-point-type hypot(floating-point-type x, floating-point-type y, floating-point-type z);
```

**Returns**: \(\sqrt{x^2 + y^2 + z^2}\).

### 28.7.4 Linear interpolation

```cpp
constexpr floating-point-type lerp(floating-point-type a, floating-point-type b, floating-point-type t) noexcept;
```

**Returns**: \(a + t(b - a)\).

**Remarks**: Let \(r\) be the value returned. If `isfinite(a) && isfinite(b)`, then:

(2.1) If \(t == 0\), then \(r == a\).

(2.2) If \(t == 1\), then \(r == b\).

(2.3) If \(t >= 0 && t <= 1\), then \(isfinite(r)\).

(2.4) If `isfinite(t) && a == b`, then \(r == a\).

(2.5) If `isfinite(t) || !isnan(t) && b-a != 0`, then `!isnan(r)`.

Let `CMP(x,y)` be `1` if \(x > y\), `-1` if \(x < y\), and `0` otherwise. For any \(t_1\) and \(t_2\), the product of `CMP(x,y)`, `CMP(t_1, t_2)`, and `CMP(b, a)` is non-negative.

### 28.7.5 Classification / comparison functions

The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library.

See also: ISO C 7.12.3, 7.12.4

### 28.7.6 Mathematical special functions

#### 28.7.6.1 General

If any argument value to any of the functions specified in 28.7.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:
(1.1) — the function description’s Returns: element explicitly specifies a domain and those argument values fall outside the specified domain, or
(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or
(1.3) — the corresponding mathematical function is not mathematically defined.

Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

28.7.6.2 Associated Laguerre polynomials

```
floating-point-type assoc_laguerre(unsigned n, unsigned m, floating-point-type x);
float assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);
```

1 Effects: These functions compute the associated Laguerre polynomials of their respective arguments n, m, and x.
2 Returns:
   \[ L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0, \]
   where \( n \) is n, \( m \) is m, and \( x \) is x.
3 Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \) or if \( m \geq 128 \).

28.7.6.3 Associated Legendre functions

```
floating-point-type assoc_legendre(unsigned l, unsigned m, floating-point-type x);
float assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

1 Effects: These functions compute the associated Legendre functions of their respective arguments l, m, and x.
2 Returns:
   \[ P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P\ell(x), \quad \text{for } |x| \leq 1, \]
   where \( l \) is l, \( m \) is m, and \( x \) is x.
3 Remarks: The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

28.7.6.4 Beta function

```
floating-point-type beta(floating-point-type x, floating-point-type y);
float betaf(float x, float y);
long double betal(long double x, long double y);
```

1 Effects: These functions compute the beta function of their respective arguments x and y.
2 Returns:
   \[ B(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, \ y > 0, \]
   where \( x \) is x and \( y \) is y.

28.7.6.5 Complete elliptic integral of the first kind

```
floating-point-type comp_ellint_1(float k);
float comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

1 Effects: These functions compute the complete elliptic integral of the first kind of their respective arguments k.
2 Returns:
   \[ K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1, \]
   where \( k \) is k.

(238) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.
3 See also 28.7.6.12.

28.7.6.6 Complete elliptic integral of the second kind

```
floating-point-type comp_ellint_2(floating-point-type k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

1 **Effects**: These functions compute the complete elliptic integral of the second kind of their respective arguments \(k\).

2 **Returns**:

\[ E(k) = E(k, \pi/2), \text{ for } |k| \leq 1, \]

where \(k\) is \(k\).

3 See also 28.7.6.13.

28.7.6.7 Complete elliptic integral of the third kind

```
floating-point-type comp_ellint_3(floating-point-type k, floating-point-type nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

1 **Effects**: These functions compute the complete elliptic integral of the third kind of their respective arguments \(k\) and \(nu\).

2 **Returns**:

\[ \Pi(\nu,k) = \Pi(\nu,k,\pi/2), \text{ for } |k| \leq 1, \]

where \(k\) is \(k\) and \(\nu\) is \(nu\).

3 See also 28.7.6.14.

28.7.6.8 Regular modified cylindrical Bessel functions

```
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 **Effects**: These functions compute the regular modified cylindrical Bessel functions of their respective arguments \(nu\) and \(x\).

2 **Returns**:

\[ I_{\nu}(x) = i^{-\nu} J_{\nu}(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \text{ for } x \geq 0, \]

where \(\nu\) is \(nu\) and \(x\) is \(x\).

3 **Remarks**: The effect of calling each of these functions is implementation-defined if \(nu \geq 128\).

4 See also 28.7.6.9.

28.7.6.9 Cylindrical Bessel functions of the first kind

```
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 **Effects**: These functions compute the cylindrical Bessel functions of the first kind of their respective arguments \(nu\) and \(x\).

2 **Returns**:

\[ J_{\nu}(x) = \sum_{k=0}^{\infty} \frac{(-1)^k(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \text{ for } x \geq 0, \]

where \(\nu\) is \(nu\) and \(x\) is \(x\).

3 **Remarks**: The effect of calling each of these functions is implementation-defined if \(nu \geq 128\). 

§ 28.7.6.9 1500
28.7.6.10 Irregular modified cylindrical Bessel functions

`cyl_bessel_k(float nu, float x);`  
`cyl_bessel_kf(float nu, float x);`  
`cyl_bessel_kl(long double nu, long double x);`

**Effects:** These functions compute the irregular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

**Returns:**

\[ K_\nu(x) = \left\{ \begin{array}{ll} \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \to \nu} \frac{I_{-\mu}(x) - I_\mu(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{array} \right. \]

where `nu` is `nu` and `x` is `x`.

**Remarks:** The effect of calling each of these functions is implementation-defined if `nu >= 128`.

See also 28.7.6.8, 28.7.6.9, 28.7.6.11.

28.7.6.11 Cylindrical Neumann functions

`cyl_neumann(float nu, float x);`  
`cyl_neumannf(float nu, float x);`  
`cyl_neumannl(long double nu, long double x);`

**Effects:** These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments `nu` and `x`.

**Returns:**

\[ N_\nu(x) = \left\{ \begin{array}{ll} J_\nu(x) \cos \nu \pi - J_{-\nu}(x) \sin \nu \pi, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim_{\mu \to \nu} J_\mu(x) \cos \mu \pi - J_{-\mu}(x) \sin \mu \pi, & \text{for } x \geq 0 \text{ and integral } \nu \end{array} \right. \]

where `nu` is `nu` and `x` is `x`.

**Remarks:** The effect of calling each of these functions is implementation-defined if `nu >= 128`.

See also 28.7.6.9.

28.7.6.12 Incomplete elliptic integral of the first kind

`ellint_1(float k, float phi);`  
`ellint_1f(float k, float phi);`  
`ellint_1l(long double k, long double phi);`

**Effects:** These functions compute the incomplete elliptic integral of the first kind of their respective arguments `k` and `phi` (phi measured in radians).

**Returns:**

\[ F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1, \]

where `k` is `k` and `phi` is `phi`.

28.7.6.13 Incomplete elliptic integral of the second kind

`ellint_2(float k, float phi);`  
`ellint_2f(float k, float phi);`  
`ellint_2l(long double k, long double phi);`

**Effects:** These functions compute the incomplete elliptic integral of the second kind of their respective arguments `k` and `phi` (phi measured in radians).

**Returns:**

\[ E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} d\theta, \text{ for } |k| \leq 1, \]

where `k` is `k` and `phi` is `phi`.
28.7.6.14 Incomplete elliptic integral of the third kind

```c
floating-point-type ellint_3(floating-point-type k, floating-point-type nu, 
floating-point-type phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

1. **Effects:** These functions compute the incomplete elliptic integral of the third kind of their respective arguments k, nu, and phi (phi measured in radians).

2. **Returns:**
   \[ \Pi(\nu, k, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta)\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1, \]
   where \( \nu \) is nu, \( k \) is k, and \( \phi \) is phi.

28.7.6.15 Exponential integral

```c
floating-point-type expint(floating-point-type x);
float expintf(float x);
long double expintl(long double x);
```

1. **Effects:** These functions compute the exponential integral of their respective arguments x.

2. **Returns:**
   \[ Ei(x) = - \int_{-\infty}^x \frac{e^{-t}}{t} \, dt \]
   where \( x \) is x.

28.7.6.16 Hermite polynomials

```c
floating-point-type hermite(unsigned n, floating-point-type x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1. **Effects:** These functions compute the Hermite polynomials of their respective arguments n and x.

2. **Returns:**
   \[ H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} \]
   where \( n \) is n and \( x \) is x.

3. **Remarks:** The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

28.7.6.17 Laguerre polynomials

```c
floating-point-type laguerre(unsigned n, floating-point-type x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1. **Effects:** These functions compute the Laguerre polynomials of their respective arguments n and x.

2. **Returns:**
   \[ L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}) , \quad \text{for } x \geq 0, \]
   where \( n \) is n and \( x \) is x.

3. **Remarks:** The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

28.7.6.18 Legendre polynomials

```c
floating-point-type legendre(unsigned l, floating-point-type x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1. **Effects:** These functions compute the Legendre polynomials of their respective arguments l and x.

2. **Returns:**
   \[ P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l , \quad \text{for } |x| \leq 1, \]
   where \( l \) is l and \( x \) is x.

3. **Remarks:** The effect of calling each of these functions is implementation-defined if \( l >= 128 \).
28.7.6.19 Riemann zeta function

```c
floating-point-type riemann_zeta(floating-point-type x);
float  riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

**Effects:** These functions compute the Riemann zeta function of their respective arguments \( x \).

\[
\zeta(x) = \begin{cases} 
\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\
\frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\
2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0
\end{cases}
\]

where \( x \) is \( x \).

28.7.6.20 Spherical Bessel functions of the first kind

```c
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float  sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

**Effects:** These functions compute the spherical Bessel functions of the first kind of their respective arguments \( n \) and \( x \).

\[
j_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0,
\]

where \( n \) is \( n \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

See also 28.7.6.9.

28.7.6.21 Spherical associated Legendre functions

```c
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float  sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

**Effects:** These functions compute the spherical associated Legendre functions of their respective arguments \( l \), \( m \), and \( \theta \) (\( \theta \) measured in radians).

\[
Y_l^m(\theta, \phi) = (-1)^m \left[ \frac{(2\ell + 1)(\ell - m)!}{4\pi (\ell + m)!} \right]^{1/2} P^m_\ell(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell,
\]

where \( \ell \) is \( l \), \( m \) is \( m \), and \( \theta \) is \( \theta \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( \ell \geq 128 \).

See also 28.7.6.3.

28.7.6.22 Spherical Neumann functions

```c
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float  sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

**Effects:** These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments \( n \) and \( x \).

\[
n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x), \quad \text{for } x \geq 0,
\]
where \( n \) is \( n \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

4 See also 28.7.6.11.

### 28.8 Numbers

#### 28.8.1 Header <numbers> synopsis

```cpp

    inline constexpr double phi = phi_v<double>;
}
```

#### 28.8.2 Mathematical constants

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of \( e \), \( \log_2 e \), \( \log_{10} e \), \( \pi \), \( \frac{1}{\sqrt{e}} \), \( \ln 2 \), \( \ln 10 \), \( \sqrt{2} \), \( \sqrt{3} \), \( \frac{1}{\sqrt{3}} \), the Euler-Mascheroni \( \gamma \) constant, and the golden ratio \( \phi \) constant \( \frac{1+\sqrt{5}}{2} \), respectively.

2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.
29 Time library

29.1 General

This Clause describes the chrono library (29.2) and various C functions (29.15) that provide generally useful time utilities, as summarized in Table 98.

29.3  Cpp17Clock requirements

A clock is a bundle consisting of a duration, a time_point, and a function now() to get the current time_point. The origin of the clock’s time_point is referred to as the clock’s epoch. A clock shall meet the requirements in Table 99.

In Table 99 C1 and C2 denote clock types. t1 and t2 are values returned by C1::now() where the call returning t1 happens before (6.9.2) the call returning t2 and both of these calls occur before C1::time_point::max(). [Note 1: This means C1 did not wrap around between t1 and t2. — end note]

Table 99: Cpp17Clock requirements

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1::rep</td>
<td>An arithmetic type or a class emulating an arithmetic type</td>
<td>The representation type of C1::duration.</td>
</tr>
<tr>
<td>C1::period</td>
<td>a specialization of ratio</td>
<td>The tick period of the clock in seconds.</td>
</tr>
<tr>
<td>C1::duration</td>
<td>chrono::duration&lt;C1::rep, C1::period&gt;</td>
<td>The duration type of the clock.</td>
</tr>
</tbody>
</table>
### Table 99: `Cpp17Clock` requirements (continued)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>C1::time_point</code></td>
<td><code>chrono::time_point&lt;C1&gt;</code> or <code>chrono::time_point&lt;C2, C1::duration&gt;</code></td>
<td>The <code>time_point</code> type of the clock. <code>C1</code> and <code>C2</code> shall refer to the same epoch.</td>
</tr>
<tr>
<td><code>C1::is_steady</code></td>
<td><code>const bool</code></td>
<td><code>true</code> if <code>t1 &lt;= t2</code> is always <code>true</code> and the time between clock ticks is constant, otherwise <code>false</code>.</td>
</tr>
<tr>
<td><code>C1::now()</code></td>
<td><code>C1::time_point</code></td>
<td>Returns a <code>time_point</code> object representing the current point in time.</td>
</tr>
</tbody>
</table>

3. *Note 2*: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — end note

4. A type `TC` meets the `Cpp17TrivialClock` requirements if:

   (4.1) `TC` meets the `Cpp17Clock` requirements,

   (4.2) the types `TC::rep`, `TC::duration`, and `TC::time_point` meet the `Cpp17EqualityComparable` (Table 28) and `Cpp17LessThanComparable` (Table 29) and `Cpp17Swappable` (16.4.4.3) requirements and the requirements of numeric types (28.2),

   *Note 3*: This means, in particular, that operations on these types will not throw exceptions. — end note

   (4.3) the function `TC::now()` does not throw exceptions, and

   (4.4) the type `TC::time_point::clock` meets the `Cpp17TrivialClock` requirements, recursively.

#### 29.4 Time-related traits

##### 29.4.1 `treat_as_floating_point`

```cpp
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

1. The `duration` template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick `period`. If `treat_as_floating_point_v<Rep>` is `true`, then implicit conversions are allowed among `durations`. Otherwise, the implicit convertibility depends on the tick periods of the `durations`.

*Note 1*: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is `false`, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions. — end note

##### 29.4.2 `duration_values`

```cpp
template<class Rep>
struct duration_values {
    public:
        static constexpr Rep zero() noexcept;
        static constexpr Rep min() noexcept;
        static constexpr Rep max() noexcept;
};
```

1. The `duration` template uses the `duration_values` trait to construct special values of the duration’s representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```cpp
static constexpr Rep zero() noexcept;
```

2. *Returns*: `Rep(0)`

   *Note 1*: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. — end note

3. *Remarks*: The value returned shall be the additive identity.
static constexpr Rep min() noexcept;
\textit{Returns: numeric\_limits\textless Rep\textgreater::lowest().}
\textit{Remarks: The value returned shall compare less than or equal to zero().}

static constexpr Rep max() noexcept;
\textit{Returns: numeric\_limits\textless Rep\textgreater::max().}
\textit{Remarks: The value returned shall compare greater than zero().}

29.4.3 Specializations of \texttt{common\_type} \hfill [time.traits.specializations]

\begin{Verbatim}
template<class Rep1, class Period1, class Rep2, class Period2>
struct common\_type\langle\texttt{chrono}\texttt{::duration}\langle\texttt{Rep1, Period1}\rangle, \texttt{chrono}\texttt{::duration}\langle\texttt{Rep2, Period2}\rangle\rangle
{ using type = \texttt{chrono}\texttt{::duration}\langle\texttt{common\_type\_t}\langle\texttt{Rep1, Rep2}\rangle, \textit{see below}\rangle; };
\end{Verbatim}

\begin{enumerate}[1.]
\item The \textit{period} of the \texttt{duration} indicated by this specialization of \texttt{common\_type} is the greatest common divisor of \texttt{Period1} and \texttt{Period2}.
\end{enumerate}

\begin{Verbatim}
[Note 1: This can be computed by forming a ratio of the greatest common divisor of \texttt{Period1::num} and \texttt{Period2::num}
 and the least common multiple of \texttt{Period1::den} and \texttt{Period2::den}. —end note]
\end{Verbatim}

\begin{Verbatim}
[Note 2: The typedef name \textit{type} is a synonym for the \texttt{duration} with the largest tick \textit{period} possible where both \texttt{duration} arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. —end note]
\end{Verbatim}

\begin{Verbatim}
template<class Clock, class Duration1, class Duration2>
struct common\_type\langle\texttt{chrono}\texttt{::time\_point}\langle\texttt{Clock, Duration1}\rangle, \texttt{chrono}\texttt{::time\_point}\langle\texttt{Clock, Duration2}\rangle\rangle
{ using type = \texttt{chrono}\texttt{::time\_point}\langle\texttt{Clock, common\_type\_t}\langle\texttt{Duration1, Duration2}\rangle\rangle; };
\end{Verbatim}

\begin{enumerate}[2.]
\item The common type of two \texttt{time\_point} types is a \texttt{time\_point} with the same clock as the two types and the common type of their two \texttt{durations}.
\end{enumerate}

29.4.4 Class template \texttt{is\_clock} \hfill [time.traits.is.clock]

\begin{Verbatim}
template<class T> struct is\_clock;
\end{Verbatim}

\begin{enumerate}[1.]
\item \texttt{is\_clock} is a \texttt{Cpp17UnaryTypeTrait} \hfill (21.3.2) with a base characteristic of \texttt{true\_type} if \texttt{T} meets the \texttt{Cpp17Clock} requirements \hfill (29.3), otherwise \texttt{false\_type}. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the \texttt{Cpp17Clock} requirements is unspecified, except that as a minimum a type \texttt{T} shall not qualify as a \texttt{Cpp17Clock} unless it meets all of the following conditions:
\begin{enumerate}[1.1]
\item the \textit{qualified-ids} \texttt{T::rep}, \texttt{T::period}, \texttt{T::duration}, and \texttt{T::time\_point} are valid and each denotes a type \hfill (13.10.3),
\item the expression \texttt{T::is\_steady} is well-formed when treated as an unevaluated operand \hfill (7.2.3),
\item the expression \texttt{T::now()} is well-formed when treated as an unevaluated operand.
\end{enumerate}
\end{enumerate}

\begin{enumerate}[2.]
\item The behavior of a program that adds specializations for \texttt{is\_clock} is undefined.
\end{enumerate}

29.5 Class template \texttt{duration} \hfill [time.duration]

29.5.1 General \hfill [time.duration.general]

\begin{Verbatim}
A \texttt{duration} type measures time between two points in time (\texttt{time\_points}). A \texttt{duration} has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template \texttt{ratio}.
\end{Verbatim}

\begin{Verbatim}
namespace std::chrono
{ template<class Rep, class Period = ratio\langle 1\rangle>
class duration{
class public:
    using rep = Rep;
    using period = typename Period::type;
}
\end{Verbatim}
private:
    rep rep_;    // exposition only

public:
    // 29.5.2, construct/copy/destroy
    constexpr duration() = default;
    template<class Rep2>
        constexpr explicit duration(const Rep2& r);
    template<class Rep2, class Period2>
        constexpr duration(const duration<Rep2, Period2>& d);
    ~duration() = default;
    duration& operator=(const duration&) = default;

    // 29.5.3, observer
    constexpr rep count() const;

    // 29.5.4, arithmetic
    constexpr common_type_t<duration> operator+() const;
    constexpr common_type_t<duration> operator-() const;
    constexpr duration& operator++();
    constexpr duration operator++(int);
    constexpr duration& operator--();
    constexpr duration operator--(int);
    constexpr duration& operator+=(const duration& d);
    constexpr duration& operator-=(const duration& d);
    constexpr duration& operator*=(const rep& rhs);
    constexpr duration& operator/=(const rep& rhs);
    constexpr duration& operator%=(const rep& rhs);
    constexpr duration& operator%=(const duration& rhs);

    // 29.5.5, special values
    static constexpr duration zero() noexcept;
    static constexpr duration min() noexcept;
    static constexpr duration max() noexcept;
};

// 29.5.2, construct/copy/destroy

template<class Rep2>
    constexpr explicit duration(const Rep2& r);

// Constraints: is_convertible_v<const Rep2&, rep> is true and
— treat_as_floating_point_v<rep> is true or

2 Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a duration type as the argument for the template parameter Rep, the program is ill-formed.

3 If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the program is ill-formed.

4 Members of duration do not throw exceptions other than those thrown by the indicated operations on their representations.

5 The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member rep_ for copy and move, respectively, would be constexpr-suitable (9.2.6).

6 [Example 1:
    duration<long, ratio<60>> d0;    // holds a count of minutes using a long
    duration<long long, milli> d1; // holds a count of milliseconds using a long long
    duration<double, ratio<1, 30>> d2; // holds a count with a tick period of \( \frac{1}{30} \) of a second
    // (30 Hz) using a double
    — end example]
— treat_as_floating_point_v<Rep2> is false.

[Example 1:
  duration<int, milli> d(3); // OK
  duration<int, milli> d2(3.5); // error
— end example]

Effects: Initializes rep_ with r.

template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);

Constraints: No overflow is induced in the conversion and treat_as_floating_point_v<rep> is true or both ratio_divide<Period2, period>::den is 1 and treat_as_floating_point_v<Rep2> is false.

[Note 1: This requirement prevents implicit truncation error when converting between integral-based duration types. Such a construction could easily lead to confusion about the value of the duration. — end note]

[Example 2:
  duration<int, milli> ms(3);
  duration<int, micro> us = ms; // OK
  duration<int, milli> ms2 = us; // error
— end example]

Effects: Initializes rep_ with duration_cast<duration>(d).count().

29.5.3 Observer

constexpr rep count() const;

Returns: rep_.

29.5.4 Arithmetic

constexpr common_type_t<duration> operator+(const duration& d) const;

Effects: Equivalent to: return duration(rep_ += d.count());

constexpr duration& operator+=(const duration& d);

Effects: Equivalent to: rep_ += d.count().

constexpr duration operator+(int);

Effects: Equivalent to: return duration(rep_ += int);

constexpr duration& operator+=(int);

Effects: Equivalent to: rep_ += int.

constexpr duration operator=(const duration& d);

Effects: Equivalent to: rep_ = d.count().

constexpr duration& operator=(const duration& d);

Effects: Equivalent to: rep_ = d.count().

§ 29.5.4
constexpr duration& operator*=(const rep& rhs);
  
  Effects: Equivalent to: rep_ *= rhs.
  
  Returns: *this.

constexpr duration& operator/=(const rep& rhs);
  
  Effects: Equivalent to: rep_ /= rhs.
  
  Returns: *this.

constexpr duration& operator%=(const rep& rhs);
  
  Effects: Equivalent to: rep_ %= rhs.
  
  Returns: *this.

constexpr duration& operator%=(const duration& rhs);
  
  Effects: Equivalent to: rep_ %= rhs.count().
  
  Returns: *this.

29.5.5 Special values

static constexpr duration zero() noexcept;
  
  Returns: duration(duration_values<rep>::zero()).

static constexpr duration min() noexcept;
  
  Returns: duration(duration_values<rep>::min()).

static constexpr duration max() noexcept;
  
  Returns: duration(duration_values<rep>::max()).

29.5.6 Non-member arithmetic

In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
  operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  
  Returns: CD(CD(lhs).count() + CD(rhs).count()).

template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
  operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  
  Returns: CD(CD(lhs).count() - CD(rhs).count()).

template<class Rep1, class Rep2, class Period>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
  operator*(const duration<Rep1, Period>& d, const Rep2& s);
  
  Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.
  
  Returns: CD(CD(d).count() * s).

template<class Rep1, class Rep2, class Period>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
  operator*(const Rep1& s, const duration<Rep2, Period>& d);
  
  Constraints: is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true.
  
  Returns: d * s.
operator/(const duration<Rep1, Period>& d, const Rep2& s);
  
  Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is not a specialization of duration.
  Returns: CD(CD(d).count() / s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<Rep1, Rep2> operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.
  Returns: CD(lhs).count() / CD(rhs).count().

29.5.7 Comparisons

In the function descriptions that follow, CT represents common_type_t<A, B>, where A and B are the types of the two arguments to the function.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  Returns: CT(lhs).count() == CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  Returns: CT(lhs).count() < CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  Returns: !(rhs < lhs).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  Returns: !((rh < lhs).

template<class Rep1, class Period1, class Rep2, class Period2>
requires three_way_comparable<typename CT::rep>
constexpr auto operator<=>(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
  Returns: CT(lhs).count() <=> CT(rhs).count().

§ 29.5.7 1525
29.5.8 Conversions

template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: Let CF be ratio_divide<Period, typename ToDuration::period>, and CR be common_type<typename ToDuration::rep, Rep, intmax_t>::type.

(2.1) If CF::num == 1 and CF::den == 1, returns
ToDuration(static_cast<typename ToDuration::rep>(d.count()))

(2.2) Otherwise, if CF::num != 1 and CF::den == 1, returns
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))

(2.3) Otherwise, if CF::num == 1 and CF::den != 1, returns
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))

(2.4) Otherwise, returns
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))

[Note 1: This function does not use any implicit conversions; all conversions are done with static_cast. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — end note]

template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: The greatest result t representable in ToDuration for which t <= d.

template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: The least result t representable in ToDuration for which t >= d.

template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: The value of ToDuration that is closest to d. If there are two closest values, then return the value t for which t % 2 == 0.

29.5.9 Suffixes for duration literals

This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds, and nanoseconds respectively if they are applied to integer-literals.

If any of these suffixes are applied to a floating-point-literal the result is a chrono::duration literal with an unspecified floating-point representation.

If any of these suffixes are applied to an integer-literal and the resulting chrono::duration value cannot be represented in the result type because of overflow, the program is ill-formed.

[Example 1: The following code shows some duration literals.

using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
— end example]
constexpr chrono::hours operator"h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator"h(long double hours);

Returns: A duration literal representing hours hours.

constexpr chrono::minutes operator"min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator"min(long double minutes);

Returns: A duration literal representing minutes minutes.

constexpr chrono::seconds operator"s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator"s(long double sec);

Returns: A duration literal representing sec seconds.

[Note 1: The same suffix 's' is used for basic_string but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

constexpr chrono::milliseconds operator"ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator"ms(long double msec);

Returns: A duration literal representing msec milliseconds.

constexpr chrono::microseconds operator"us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator"us(long double usec);

Returns: A duration literal representing usec microseconds.

constexpr chrono::nanoseconds operator"ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator"ns(long double nsec);

Returns: A duration literal representing nsec nanoseconds.

29.5.10 Algorithms (time.duration.alg)

template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);

Constraints: numeric_limits<Rep>::is_signed is true.

Returns: If d >= d.zero(), return d, otherwise return -d.

29.5.11 I/O (time.duration.io)

template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);

Effects: Inserts the duration d onto the stream os as if it were implemented as follows:

  basic_ostringstream<charT, traits> s;
  s.flags(os.flags());
  s.imbue(os.getloc());
  s.precision(os.precision());
  s << d.count() << units-suffix;
  return os << s.str();

where units-suffix depends on the type Period::type as follows:

  (1.1) If Period::type is atto, units-suffix is "as".
  (1.2) Otherwise, if Period::type is femto, units-suffix is "fs".
  (1.3) Otherwise, if Period::type is pico, units-suffix is "ps".
  (1.4) Otherwise, if Period::type is nano, units-suffix is "ns".
  (1.5) Otherwise, if Period::type is micro, it is implementation-defined whether units-suffix is "µs" ("\u00b5\u0073") or "us".
  (1.6) Otherwise, if Period::type is milli, units-suffix is "ms".
  (1.7) Otherwise, if Period::type is centi, units-suffix is "cs".
  (1.8) Otherwise, if Period::type is deci, units-suffix is "ds".
— Otherwise, if Period::type is ratio<1>, units-suffix is "s".
— Otherwise, if Period::type is deca, units-suffix is "das".
— Otherwise, if Period::type is hecto, units-suffix is "hs".
— Otherwise, if Period::type is kilo, units-suffix is "ks".
— Otherwise, if Period::type is mega, units-suffix is "Ms".
— Otherwise, if Period::type is giga, units-suffix is "Gs".
— Otherwise, if Period::type is tera, units-suffix is "Ts".
— Otherwise, if Period::type is peta, units-suffix is "Ps".
— Otherwise, if Period::type is exa, units-suffix is "Es".
— Otherwise, if Period::type is ratio<60>, units-suffix is "min".
— Otherwise, if Period::type is ratio<3600>, units-suffix is "h".
— Otherwise, if Period::type is ratio<86400>, units-suffix is "d".
— Otherwise, if Period::type::den == 1, units-suffix is "[num]s".
— Otherwise, units-suffix is "[num/den]s".

In the list above, the use of num and den refers to the static data members of Period::type, which are converted to arrays of charT using a decimal conversion with no leading zeroes.

Returns: os.

```cpp
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
duration<Rep, Period>& d,
basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

Effects: Attempts to parse the input stream is into the duration d using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid duration, is.setstate(ios_base::failbit) is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.6 Class template time_point

29.6.1 General

namespace std::chrono {
  template<class Clock, class Duration = typename Clock::duration>
  class time_point {
    public:
      using clock = Clock;
      using duration = Duration;
      using rep = typename duration::rep;
      using period = typename duration::period;

    private:
      duration d_; // exposition only

    public:
      // 29.6.2, construct
      constexpr time_point(); // has value epoch
      constexpr explicit time_point(const duration& d); // same as time_point() + d
      template<class Duration2>
        constexpr time_point(const time_point<clock, Duration2>& t);

      // 29.6.3, observer
      constexpr duration time_since_epoch() const;
  }
// § 29.6.4, arithmetic
constexpr time_point& operator++();
constexpr time_point operator++(int);
constexpr time_point& operator--();
constexpr time_point operator--(int);
constexpr time_point& operator+=(const duration& d);
constexpr time_point& operator-=(const duration& d);

// § 29.6.5, special values
static constexpr time_point min() noexcept;
static constexpr time_point max() noexcept;
};

1  If Duration is not a specialization of duration, the program is ill-formed.

29.6.2 Constructors

constexpr time_point();
1  Effects: Initializes d_ with duration::zero(). Such a time_point object represents the epoch.

constexpr explicit time_point(const duration& d);
2  Effects: Initializes d_ with d. Such a time_point object represents the epoch + d.

template<class Duration2>
constexpr time_point(const time_point<clock, Duration2>& t);
3  Constraints: is_convertible_v<Duration2, duration> is true.
4  Effects: Initializes d_ with t.time_since_epoch().

29.6.3 Observer

customexpr duration time_since_epoch() const;
1  Returns: d_.

29.6.4 Arithmetic

constexpr time_point& operator++();
1  Effects: Equivalent to: ++d_.
2  Returns: *this.

constexpr time_point operator++(int);
3  Effects: Equivalent to: return time_point{d_++};

constexpr time_point& operator--();
4  Effects: Equivalent to: --d_.
5  Returns: *this.

constexpr time_point operator--(int);
6  Effects: Equivalent to: return time_point{d_--};

constexpr time_point& operator+=(const duration& d);
7  Effects: Equivalent to: d_ += d.
8  Returns: *this.

constexpr time_point& operator-=(const duration& d);
9  Effects: Equivalent to: d_ -= d.
10  Returns: *this.
29.6.5 Special values

static constexpr time_point min() noexcept;

Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;

Returns: time_point(duration::max()).

29.6.6 Non-member arithmetic

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>
operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.

template<class Clock, class Duration1, class Duration2>
constexpr common_type_t<Duration1, Duration2>
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() - rhs.time_since_epoch().

29.6.7 Comparisons

template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() < rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs < rhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=>(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

§ 29.6.7
const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() <=> rhs.time_since_epoch().

29.6.8 Conversions [time.point.cast]

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

Constraints: ToDuration is a specialization of duration.

Returns:
time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration, and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()))

29.7 Clocks [time.clock]

29.7.1 General [time.clock.general]
The types defined in 29.7 meet the Cpp17TrivialClock requirements (29.3) unless otherwise specified.

29.7.2 Class system_clock [time.clock.system]

29.7.2.1 Overview [time.clock.system.overview]

namespace std::chrono {
    class system_clock {
        public:
            using rep = see below;
            using period = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<system_clock>;
            static constexpr bool is_steady = unspecified;

            static time_point now() noexcept;

            // mapping to/from C type time_t
            static time_t to_time_t(const time_point& t) noexcept;
            static time_point from_time_t(time_t t) noexcept;
        }
    }

Objects of type system_clock represent wall clock time from the system-wide realtime clock. Objects of type sys_time<Duration> measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as Unix time. This measure facilitates an efficient mapping between sys_time and calendar types (29.8).

[Example 1: sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.
 sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.
—end example]
29.7.2.2 Members

using system_clock::rep = unspecified;

Constraints: system_clock::duration::min() < system_clock::duration::zero() is true.

[Note 1: This implies that rep is a signed type. — end note]

static time_t to_time_t(const time_point& t) noexcept;

Returns: A time_t object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

static time_point from_time_t(time_t t) noexcept;

Returns: A time_point object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

29.7.2.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);

Constraints: treat_as_floating_point_v<typename Duration::rep> is false, and Duration{1} < days{1} is true.

Effects: Equivalent to:

return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}", tp);

[Example 1:

cout << sys_seconds{0s} << 'n'; // 1970-01-01 00:00:00

cout << sys_seconds{946684800s} << 'n'; // 2000-01-01 00:00:00

cout << sys_seconds{946688523s} << 'n'; // 2000-01-01 01:02:03

—end example]

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);

Effects: os << year_month_day(dp).

Returns: os.

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the sys_time tp using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

29.7.3 Class utc_clock

29.7.3.1 Overview

namespace std::chrono {

class utc_clock {

public:

using rep = a signed arithmetic type;

using period = ratio<unspecified, unspecified>;

using duration = chrono::duration<rep, period>;

using time_point = chrono::time_point<utc_clock>;
static constexpr bool is_steady = unspecified;

static time_point now();

template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& t);

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);

1 In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated
time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[Note 1: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one
can add/subtract the constant sys_days{1972y/1/1} - sys_days{1970y/1/1} (63'072'000s) from the utc_time.
—end note]

[Example 1:
clock_cast<utc_clock>(sys_seconds(sys_days{1970y/January/1}).time_since_epoch()).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds(sys_days{2000y/January/1}).time_since_epoch()).time_since_epoch() is 946'684'822s,
which is 10'957 * 86'400s + 22s.
—end example]

2 utc_clock is not a Cpp17TrivialClock unless the implementation can guarantee that utc_clock::now() does not propagate an exception.

[Note 2: noexcept(from_sys(system_clock::now())) is false. —end note]

29.7.3.2 Member functions

static time_point now();
1 Returns: from_sys(system_clock::now()), or a more accurate value of utc_time.

template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);
2 Returns: A sys_time t, such that from_sys(t) == u if such a mapping exists. Otherwise u represents
a time_point during a positive leap second insertion, the conversion counts that leap second as not
inserted, and the last representable value of sys_time prior to the insertion of the leap second is
returned.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);
3 Returns: A utc_time u, such that u.time_since_epoch() - t.time_since_epoch() is equal to the
sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second
insertion, then the conversion counts that leap second as inserted.

[Example 1:
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t *= ins;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t *= ins;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
]
29.7.3.3 Non-member functions

```cpp
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);
```

Effects: Equivalent to:

```cpp
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

[Example 1:

```cpp
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC"
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC
```

]—end example]

```cpp
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

Effects: Attempts to parse the input stream is into the utc_time tp using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

```cpp
struct leap_second_info {
    bool is_leap_second;
    seconds elapsed;
};
```

The type `leap_second_info` has data members and special members specified above. It has no base classes or members other than those specified.

```cpp
template<class Duration>
    leap_second_info get_leap_second_info(const utc_time<Duration>& ut);
```

Returns: A `leap_second_info lsi`, where lsi.is_leap_second is true if ut is during a positive leap second insertion, and otherwise false. lsi.elapsed is the sum of leap seconds between 1970-01-01 and ut. If lsi.is_leap_second is true, the leap second referred to by ut is included in the sum.

29.7.4 Class tai_clock

29.7.4.1 Overview

namespace std::chrono {
    class tai_clock {
    public:
        using rep = a signed arithmetic type;
        using period = ratio<unspecifed, unspecifed>;
```
using duration = chrono::duration<rep, period>;
using time_point = chrono::time_point<tai_clock>;
static constexpr bool is_steady = unspecified;

static time_point now();

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>&) noexcept;

static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>&) noexcept;
}

1 The clock tai_clock measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this
date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not
inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with
respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted
so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

tai_clock is not a Cpp17TrivialClock unless the implementation can guarantee that tai_clock::now()
does not propagate an exception.

[Note 1: noexcept(from_utc(utc_clock::now())) is false. — end note]

29.7.4.2 Member functions [time.clock.tai.members]

static time_point now();

1 Returns: from_utc(utc_clock::now()), or a more accurate value of tai_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>& t) noexcept;

2 Returns:
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s

[Note 1: 378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
— end note]

template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;

3 Returns:
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s

[Note 2: 378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
— end note]

29.7.4.3 Non-member functions [time.clock.tai.nonmembers]

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);

1 Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

[Example 1:
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
]
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>

basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the tai_time tp using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

29.7.5 Class gps_clock

29.7.5.1 Overview

namespace std::chrono {

  class gps_clock {
    public:
      using rep = a signed arithmetic type;
      using period = ratio<unspecified, unspecified>;
      using duration = chrono::duration<rep, period>;
      using time_point = chrono::time_point<gps_clock>;
      static constexpr bool is_steady = unspecified;

      static time_point now();

      template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
to_utc(const gps_time<Duration>& t) noexcept;

      template<class Duration>
      static gps_time<common_type_t<Duration, seconds>>
      from_utc(const utc_time<Duration>& t) noexcept;
  };
}

1 The clock gps_clock measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

2 gps_clock is not a Cpp17TrivialClock unless the implementation can guarantee that gps_clock::now() does not propagate an exception.

[Note 1: noexcept(from_utc utc_clock::now())) is false. — end note]

29.7.5.2 Member functions

static time_point now();

Returns: from_utc(utc_clock::now()), or a more accurate value of gps_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const gps_time<Duration>& t) noexcept;

Returns:
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;

Returns:
    gps_time<common_type_t<Duration, seconds>>(t.time_since_epoch()) - 315964809s

Note 2:
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
—end note

29.7.5.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);

Effects: Equivalent to:
    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

Example 1:
    auto st = sys_days{2000y/January/1};
    auto gt = clock_cast<gps_clock>(st);
    cout << format("0:%F %T %Z" == 1:%F %T %Z\n"n, st, gt);

Produces this output:
    2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
—end example

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the gps_time tp using the format flags given in
    the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit)
    is called and tp is not modified. If %Z is used and successfully parsed, that value will
    be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully
    parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset
    will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

29.7.6 Type file_clock

29.7.6.1 Overview

namespace std::chrono {
    using file_clock = see below;
}

file_clock is an alias for a type meeting the Cpp17TrivialClock requirements (29.3), and using a signed
    arithmetic type for file_clock::rep. file_clock is used to create the time_point system used for
    file_time_type (31.12). Its epoch is unspecified, and noexcept(file_clock::now()) is true.

Note 1: The type that file_clock denotes can be in a different namespace than std::chrono, such as std::filesystem. —end note

29.7.6.2 Member functions

The type denoted by file_clock provides precisely one of the following two sets of static member functions:
template<class Duration>
static systime<see below>
  to_systime(const filetime<Duration>&);
template<class Duration>
static filetime<see above>
  from_systime(const systime<Duration>&);

or:
template<class Duration>
static utc_time<see below>
  to_utc(const filetime<Duration>&);
template<class Duration>
static filetime<see above>
  from_utc(const utc_time<Duration>&);

These member functions shall provide time_point conversions consistent with those specified by utc_clock,
tai_clock, and gps_clock. The Duration of the resultant time_point is computed from the Duration of
the input time_point.

29.7.6.3 Non-member functions [time.clock.file.nonmembers]
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
  operator<<(basic_ostream<charT, traits>& os, const filetime<Duration>& t);

1 Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
  from_stream(basic_istream<charT, traits>& is, const charT* fmt,
filetime<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

2 Effects: Attempts to parse the input stream is into the file_time tp using the format flags given
in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will
be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully
parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset
will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

3 Returns: is.

29.7.7 Class steady_clock [time.clock.steady]
namespace std::chrono {
  class steady_clock {
    public:
      using rep = unspecified;
      using period = ratio<unspecified, unspecified>;
      using duration = chrono::duration<rep, period>;
      using time_point = chrono::time_point<unspecified, duration>;
      static constexpr bool is_steady = true;

      static time_point now() noexcept;
  };
}

1 Objects of class steady_clock represent clocks for which values of time_point never decrease as physical
time advances and for which values of time_point advance at a steady rate relative to real time. That is,
the clock may not be adjusted.

29.7.8 Class high_resolution_clock [time.clock.hires]
namespace std::chrono {
  class high_resolution_clock {
    public:
      using rep = unspecified;

   .§ 29.7.8 1538
using period = ratio<unspecified, unspecified>;
using duration = chrono::duration<rep, period>;
using time_point = chrono::time_point<unspecified, duration>;
static constexpr bool is_steady = unspecified;

static time_point now() noexcept;
}

Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

### 29.7.9 Local time

The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```cpp
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
```

**Effects:**

```
    os << sys_time<Duration>{lt.time_since_epoch()};
```

**Returns:** `os`.

```cpp
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
        from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

**Effects:** Attempts to parse the input stream `is` into the `local_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

**Returns:** `is`.

### 29.7.10 time_point conversions

#### 29.7.10.1 Class template clock_time_conversion

```cpp
namespace std::chrono {
    template<class DestClock, class SourceClock>
    struct clock_time_conversion {};
}
```

`clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified `operator()` that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.

Several specializations are provided by the implementation, as described in 29.7.10.2, 29.7.10.3, 29.7.10.4, and 29.7.10.5.
29.7.10.2 Identity conversions

```cpp
template<class Clock>
struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
    time_point<Clock, Duration>
    operator()(const time_point<Clock, Duration>& t) const;
};

template<class Duration>
time_point<Clock, Duration>
operator()(const time_point<Clock, Duration>& t) const;

Returns: t.
```

```cpp
template<class Duration>
sys_time<Duration>
operator()(const sys_time<Duration>& t) const;

Returns: t.
```

```cpp
template<class Duration>
utc_time<Duration>
operator()(const utc_time<Duration>& t) const;

Returns: t.
```

29.7.10.3 Conversions between `system_clock` and `utc_clock`

```cpp
template<class Duration>
utc_time<common_type_t<Duration, seconds>>
operator()(const sys_time<Duration>& t) const;

Returns: `utc_clock::from_sys(t)`.
```

```cpp
template<class Duration>
sys_time<common_type_t<Duration, seconds>>
operator()(const utc_time<Duration>& t) const;

Returns: `utc_clock::to_sys(t)`.
```
29.7.10.4 Conversions between system\_clock and other clocks

```
template<class SourceClock>
struct clock\_time\_conversion\<system\_clock, SourceClock> {
  template<class Duration>
  auto operator()(const time\_point\<SourceClock, Duration>& t) const
  -> decltype(SourceClock::to\_sys(t));
};
```

```
template<class Duration>
auto operator()(const time\_point\<SourceClock, Duration>& t) const
-> decltype(SourceClock::to\_sys(t));
```

1. Constraints: Source\_Clock::to\_sys(t) is well-formed.
2. Mandates: Source\_Clock::to\_sys(t) returns a sys\_time<Duration2> for some type Duration2 (29.6.1).
3. Returns: Source\_Clock::to\_sys(t).

```
template<class DestClock>
struct clock\_time\_conversion\<DestClock, system\_clock> {
  template<class Duration>
  auto operator()(const sys\_time<Duration>& t) const
  -> decltype(DestClock::from\_sys(t));
};
```

```
template<class Duration>
auto operator()(const sys\_time<Duration>& t) const
-> decltype(DestClock::from\_sys(t));
```

4. Constraints: Dest\_Clock::from\_sys(t) is well-formed.
5. Mandates: Dest\_Clock::from\_sys(t) returns a time\_point<Dest\_Clock, Duration2> for some type Duration2 (29.6.1).
6. Returns: Dest\_Clock::from\_sys(t).

29.7.10.5 Conversions between utc\_clock and other clocks

```
template<class SourceClock>
struct clock\_time\_conversion\<utc\_clock, SourceClock> {
  template<class Duration>
  auto operator()(const time\_point\<SourceClock, Duration>& t) const
  -> decltype(SourceClock::to\_utc(t));
};
```

```
template<class Duration>
auto operator()(const time\_point\<SourceClock, Duration>& t) const
-> decltype(SourceClock::to\_utc(t));
```

1. Constraints: Source\_Clock::to\_utc(t) is well-formed.
2. Mandates: Source\_Clock::to\_utc(t) returns a utc\_time<Duration2> for some type Duration2 (29.6.1).
3. Returns: Source\_Clock::to\_utc(t).

```
template<class DestClock>
struct clock\_time\_conversion\<DestClock, utc\_clock> {
  template<class Duration>
  auto operator()(const utc\_time<Duration>& t) const
  -> decltype(DestClock::from\_utc(t));
};
```

```
template<class Duration>
auto operator()(const utc\_time<Duration>& t) const
-> decltype(DestClock::from\_utc(t));
```

4. Constraints: Dest\_Clock::from\_utc(t) is well-formed.
5. Mandates: Dest\_Clock::from\_utc(t) returns a time\_point<Dest\_Clock, Duration2> for some type Duration2 (29.6.1).
Returns: \texttt{DestClock::from_utc(t)}.

29.7.10.6 Function template \texttt{clock_cast}

\begin{verbatim}
template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);
\end{verbatim}

\textit{Constraints:} At least one of the following clock time conversion expressions is well-formed:

\begin{enumerate}
\item clock_time_conversion<DestClock, SourceClock>()(t)
\item clock_time_conversion<DestClock, system_clock>()(
    clock_time_conversion<system_clock, SourceClock>()(t))
\item clock_time_conversion<DestClock, utc_clock>()(
    clock_time_conversion<utc_clock, SourceClock>()(t))
\item clock_time_conversion<DestClock, utc_clock>()(
    clock_time_conversion<utc_clock, system_clock>()(
    clock_time_conversion<system_clock, SourceClock>()(t)))
\item clock_time_conversion<DestClock, system_clock>()(
    clock_time_conversion<system_clock, utc_clock>()(
    clock_time_conversion<utc_clock, SourceClock>()(t)))
\end{enumerate}

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer \texttt{operator()} calls on \texttt{clock_time_conversion} specializations.

\textit{Mandates:} Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

\textit{Returns:} The best well-formed clock time conversion expression in the above list.

29.8 The civil calendar

29.8.1 In general

The types in 29.8 describe the civil (Gregorian) calendar and its relationship to \texttt{sys_days} and \texttt{local_days}.

29.8.2 Class \texttt{last_spec}

\begin{verbatim}
namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}
\end{verbatim}

The type \texttt{last_spec} is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

29.8.3 Class \texttt{day}

29.8.3.1 Overview

\begin{verbatim}
namespace std::chrono {
    class day {
        unsigned char d_; // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;
        constexpr day& operator++() noexcept;
        constexpr day operator++(int) noexcept;
        constexpr day& operator--() noexcept;
        constexpr day operator--(int) noexcept;
        constexpr day& operator+=(const days& d) noexcept;
        constexpr day& operator-=(const days& d) noexcept;
    };
}
\end{verbatim}

\section*{§ 29.8.3.1}

1542
constexpr explicit operator unsigned() const noexcept;
constexpr bool ok() const noexcept;
};

1 day represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into day’s unspecified internal storage. day meets the Cpp17EqualityComparable (Table 28) and Cpp17LessThanComparable (Table 29) requirements, and participates in basic arithmetic with days objects, which represent a difference between two day objects.

2 day is a trivially copyable and standard-layout class type.

29.8.3.2 Member functions

constexpr explicit day(unsigned d) noexcept;

1 Effects: Initializes d_ with d. The value held is unspecified if d is not in the range [0, 255].

constexpr day& operator++() noexcept;

2 Effects: ++d_.
3 Returns: *this.

constexpr day operator++(int) noexcept;

4 Effects: ++(*this).
5 Returns: A copy of *this as it existed on entry to this member function.

constexpr day& operator--() noexcept;

6 Effects: Equivalent to: --d_.
7 Returns: *this.

constexpr day operator--(int) noexcept;

8 Effects: --(*this).
9 Returns: A copy of *this as it existed on entry to this member function.

constexpr day& operator+=(const days& d) noexcept;

10 Effects: *this = *this + d.
11 Returns: *this.

constexpr day& operator-=(const days& d) noexcept;

12 Effects: *this = *this - d.
13 Returns: *this.

constexpr explicit operator unsigned() const noexcept;

14 Returns: d_.

constexpr bool ok() const noexcept;

15 Returns: 1 <= d_ && d_ <= 31.

29.8.3.3 Non-member functions

constexpr bool operator==(const day& x, const day& y) noexcept;

1 Returns: unsigned{x} == unsigned{y}.

castexpr strong_ordering operator<(const day& x, const day& y) noexcept;

2 Returns: unsigned{x} <= unsigned{y}.

castexpr day operator+(const day& x, const days& y) noexcept;

3 Returns: day(unsigned{x} + y.count()).
constexpr day operator+(const days& x, const day& y) noexcept;

Returns: \( y + x \).

cconstexpr day operator-(const day& x, const days& y) noexcept;

Returns: \( x + -y \).

cconstexpr days operator-(const day& x, const day& y) noexcept;

Returns: \( \text{days}\{\text{int(unsigned}(x)) - \text{int(unsigned}(y))}\).
29.8.4.2 Member functions

```cpp
constexpr explicit month(unsigned m) noexcept;
Effects: Initializes m_ with m. The value held is unspecified if m is not in the range [0, 255].
```

```cpp
constexpr month& operator++() noexcept;
Effects: *this += months{1}.
Returns: *this.
```

```cpp
constexpr month operator++(int) noexcept;
Effects: ++(*this).
Returns: A copy of *this as it existed on entry to this member function.
```

```cpp
constexpr month& operator--() noexcept;
Effects: *this -= months{1}.
Returns: *this.
```

```cpp
constexpr month operator--(int) noexcept;
Effects: --(*this).
Returns: *this.
```

```cpp
constexpr month& operator+=(const months& m) noexcept;
Effects: *this = *this + m.
Returns: *this.
```

```cpp
constexpr month& operator-=(const months& m) noexcept;
Effects: *this = *this - m.
Returns: *this.
```

```cpp
constexpr explicit operator unsigned() const noexcept;
Returns: m_.
```

```cpp
constexpr bool ok() const noexcept;
Returns: 1 <= m_ && m_ <= 12.
```

29.8.4.3 Non-member functions

```cpp
constexpr bool operator==(const month& x, const month& y) noexcept;
Returns: unsigned{x} == unsigned{y}.
```

```cpp
constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;
Returns: unsigned{x} <=> unsigned{y}.
```

```cpp
constexpr month operator+(const month& x, const months& y) noexcept;
Returns: month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
where modulo(n, 12) computes the remainder of n divided by 12 using Euclidean division.
[Note 1: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 11]. Assuming no overflow in the signed summation, this operation results in a month holding a value in the range [1, 12] even if !x.ok(). — end note]
[Example 1: February + months{11} == January. — end example]
```

```cpp
constexpr month operator+(const months& x, const month& y) noexcept;
Returns: y + x.
```
constexpr month operator-(const month& x, const months& y) noexcept;

Returns: \( x + -y \).

constexpr months operator-(const month& x, const month& y) noexcept;

Returns: If \( x.ok() == \text{true} \) and \( y.ok() == \text{true} \), returns a value \( m \) in the range \([\text{months}(0), \text{months}(11)]\) satisfying \( y + m == x \). Otherwise the value returned is unspecified.

[Example 2: January - February == months(11). — end example]

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month& m);
```

Effects: Equivalent to:
```
return os << (m.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
        static_cast<unsigned>(m)));
```

```cpp
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);
```

Effects: Attempts to parse the input stream \( is \) into the month \( m \) using the format flags given in the NTCTS \( \text{fmt} \) as specified in 29.13. If the parse fails to decode a valid month, \( is.setstate(ios_base::failbit) \) is called and \( m \) is not modified. If \( \%Z \) is used and successfully parsed, that value will be assigned to \( *\text{abbrev} \) if \( \text{abbrev} \) is non-null. If \( \%z \) (or a modified variant) is used and successfully parsed, that value will be assigned to \( *\text{offset} \) if \( \text{offset} \) is non-null.

Returns: \( is \).

29.8.5 Class year
[time.cal.year]

29.8.5.1 Overview
[time.cal.year.overview]

```cpp
namespace std::chrono {
    class year {
        short y_; // exposition only
    public:
        year() = default;
        constexpr explicit year(int y) noexcept;
        constexpr year& operator++() noexcept;
        constexpr year operator++(int) noexcept;
        constexpr year& operator--() noexcept;
        constexpr year operator--(int) noexcept;
        constexpr year& operator+=(const years& y) noexcept;
        constexpr year& operator-=(const years& y) noexcept;
        constexpr year operator+(int) const noexcept;
        constexpr year operator-(int) const noexcept;
        constexpr bool is_leap() const noexcept;
        constexpr explicit operator int() const noexcept;
        constexpr bool ok() const noexcept;

        static constexpr year min() noexcept;
        static constexpr year max() noexcept;
    };
}
```

1 year represents a year in the civil calendar. It can represent values in the range \([\text{min()}, \text{max()}]\). It can be constructed with any \( \text{int} \) value, which will be subsequently truncated to fit into year’s unspecified internal
storage. `year` meets the `Cpp17EqualityComparable` (Table 28) and `Cpp17LessThanComparable` (Table 29) requirements, and participates in basic arithmetic with `years` objects, which represent a difference between two `year` objects. 

2 `year` is a trivially copyable and standard-layout class type.

### 29.8.5.2 Member functions

```cpp
constexpr explicit year(int y) noexcept;

Effects: Initializes `y_` with `y`. The value held is unspecified if `y` is not in the range `[-32767, 32767]`.
```
```cpp
constexpr year& operator++() noexcept;

Effects: `++y_`.
Returns: `*this`.
```
```cpp
constexpr year operator++(int) noexcept;

Effects: `++(*this)`.
Returns: A copy of `*this` as it existed on entry to this member function.
```
```cpp
constexpr year& operator--() noexcept;

Effects: `--y_`.
Returns: `*this`.
```
```cpp
constexpr year operator--(int) noexcept;

Effects: `--(*this)`.
Returns: A copy of `*this` as it existed on entry to this member function.
```
```cpp
constexpr year& operator+=(const years& y) noexcept;

Effects: `*this = *this + y`.
Returns: `*this`.
```
```cpp
constexpr year& operator-=(const years& y) noexcept;

Effects: `*this = *this - y`.
Returns: `*this`.
```
```cpp
constexpr year operator+() const noexcept;

Returns: `*this`.
```
```cpp
constexpr year operator-() const noexcept;

Returns: `year{-y_}`.
```
```cpp
constexpr bool is_leap() const noexcept;

Returns: `y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0)`.
```
```cpp
constexpr explicit operator int() const noexcept;

Returns: `y_`.
```
```cpp
constexpr bool ok() const noexcept;

Returns: `min().y_ <= y_ && y_ <= max().y_`.
```
```cpp
static constexpr year min() noexcept;

Returns: `year{-32767}`.
```
```cpp
static constexpr year max() noexcept;

Returns: `year{32767}`.
```
29.8.5.3 Non-member functions

```cpp
constexpr bool operator==(const year& x, const year& y) noexcept;
Returns: \text{int}(x) == \text{int}(y).
```

```cpp
constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;
Returns: \text{int}(x) <=> \text{int}(y).
```

```cpp
constexpr year operator+(const year& x, const years& y) noexcept;
Returns: year\{\text{int}(x) + \text{static\_cast\_int}(y.\text{count()})\}.
```

```cpp
constexpr year operator+(const years& x, const year& y) noexcept;
Returns: y + x.
```

```cpp
constexpr year operator-(const year& x, const years& y) noexcept;
Returns: x + -y.
```

```cpp
constexpr years operator-(const year& x, const year& y) noexcept;
Returns: years\{\text{int}(x) - \text{int}(y)\}.
```

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);
Effects: Equivalent to:
\begin{verbatim}
return os << (y.ok() ?
   format\text{STATICALLY\_WIDEN\textchar{<charT>}(\text"{:Y}\text"), y :}
   format\text{STATICALLY\_WIDEN\textchar{<charT>}(\text"{:Y} is not a valid year\"), y});
\end{verbatim}
```

```cpp
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>&& is, const charT* fmt,
year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
Effects: Attempts to parse the input stream is into the year y using the format flags
given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year,
is.setstate\{ios\_base::failbit\} is called and y is not modified. If \%Z is used and successfully parsed,
that value will be assigned to *abbrev if abbrev is non-null. If \%z (or a modified variant)
is used and successfully parsed, that value will be assigned to *offset if offset is non-null.
Returns: is.
```

```cpp
constexpr chrono::year operator"y(unsigned long long y) noexcept;
Returns: year\{\text{static\_cast\_int}(y)\}.
```

29.8.6 Class weekday

29.8.6.1 Overview
constexpr weekday& operator+=(const days& d) noexcept;
constexpr weekday& operator-=(const days& d) noexcept;

constexpr unsigned c_encoding() const noexcept;
constexpr unsigned iso_encoding() const noexcept;
constexpr bool ok() const noexcept;
constexpr weekday_indexed operator[](unsigned index) const noexcept;
constexpr weekday_last operator[](last_spec) const noexcept;
};

weekday represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into weekday’s unspecified internal storage. weekday meets the Cpp17EqualityComparable (Table 28) requirements.

[Note 1: weekday is not Cpp17LessThanComparable because there is no universal consensus on which day is the first day of the week. weekday’s arithmetic operations treat the days of the week as a circular range, with no beginning and no end. — end note]

weekday is a trivially copyable and standard-layout class type.

29.8.6.2 Member functions

constexpr explicit weekday(unsigned wd) noexcept;
1 Effects: Initializes wd_ with wd == 7 ? 0 : wd. The value held is unspecified if wd is not in the range [0, 255].

constexpr weekday(const sys_days& dp) noexcept;
2 Effects: Computes what day of the week corresponds to the sys_days dp, and initializes that day of the week in wd_.
3 [Example 1: If dp represents 1970-01-01, the constructed weekday represents Thursday by storing 4 in wd_.
—end example]

constexpr explicit weekday(const local_days& dp) noexcept;
4 Effects: Computes what day of the week corresponds to the local_days dp, and initializes that day of the week in wd_.
5 Postconditions: The value is identical to that constructed from sys_days{dp.time_since_epoch()}.}

constexpr weekday& operator++() noexcept;
6 Effects: *this += days{1}.
7 Returns: *this.

constexpr weekday operator++(int) noexcept;
8 Effects: ++(*this).
9 Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator--() noexcept;
10 Effects: *this -= days{1}.
11 Returns: *this.

constexpr weekday operator--(int) noexcept;
12 Effects: --(*this).
13 Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator+=(const days& d) noexcept;
14 Effects: *this = *this + d.
15 Returns: *this.

§ 29.8.6.2 1549
constexpr weekday& operator-=(const days& d) noexcept;

Effects: *this = *this - d.

Returns: *this.

constexpr unsigned c_encoding() const noexcept;

Returns: wd_.

constexpr unsigned iso_encoding() const noexcept;

Returns: wd_ == 0u ? 7u : wd_.

constexpr bool ok() const noexcept;

Returns: wd_ <= 6.

constexpr weekday_indexed operator[](unsigned index) const noexcept;

Returns: {*this, index}.

constexpr weekday_last operator[]() const noexcept;

Returns: weekday_last{*this}.

29.8.6.3 Non-member functions [time.cal.wd.nonmembers]

constexpr bool operator==(const weekday& x, const weekday& y) noexcept;

Returns: x.wd_ == y.wd_.

constexpr weekday operator+(const weekday& x, const days& y) noexcept;

Returns: y + x.

constexpr weekday operator+(const days& x, const weekday& y) noexcept;

Returns: If x.ok() == true and y.ok() == true, returns a value d in the range [days{0}, days{6}]
satisfying y + d == x. Otherwise the value returned is unspecified.

Example 2: Sunday - Monday == days{6}.

Example 1: Monday + days{6} == Sunday.

constexpr weekday operator*(const weekday& x, const days& y) noexcept;

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday& wd);

Effects: Equivalent to:

return os << (wd.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%a}"), wd):
    format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid weekday"),
    static_cast<unsigned>(wd.wd_)));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the weekday wd using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid weekday, is.setstate(ios_base::failbit) is called and wd is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.7 Class weekday_indexed

29.8.7.1 Overview

namespace std::chrono {
    class weekday_indexed {
        using::weekday wd_; // exposition only
        unsigned char index_; // exposition only
    public:
        weekday_indexed() = default;
        constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
        constexpr chrono::weekday weekday() const noexcept;
        constexpr unsigned index() const noexcept;
        constexpr bool ok() const noexcept;
    }
}

1 weekday_indexed represents a weekday and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

2 [Note 1: A weekday_indexed object can be constructed by indexing a weekday with an unsigned. —end note]

[Example 1:]
    constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
    static_assert(wdi.weekday() == Sunday);
    static_assert(wdi.index() == 2);
    — end example]

3 weekday_indexed is a trivially copyable and standard-layout class type.

29.8.7.2 Member functions

constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

Effects: Initializes wd_ with wd and index_ with index. The values held are unspecified if !wd.ok() or index is not in the range [0, 7].

constexpr chrono::weekday weekday() const noexcept;

Returns: wd_.

constexpr unsigned index() const noexcept;

Returns: index_.

constexpr bool ok() const noexcept;

Returns: wd_.ok() && 1 <= index_ && index_ <= 5.

29.8.7.3 Non-member functions

constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;

Returns: x.weekday() == y.weekday() && x.index() == y.index().

template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);

Effects: Equivalent to:
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
    format(os.getloc(), STATICALLY-WIDEN<
    charT>("{:L}[{i}]"), wdi.weekday(), i) :
    format(os.getloc(), STATICALLY-WIDEN<
    charT>("{:L}[{i} is not a valid index]"),
    wdi.weekday(), i));

29.8.8 Class weekday_last

29.8.8.1 Overview

namespace std::chrono {
    class weekday_last {
        chrono::weekday wd_; // exposition only
    public:
        constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
        constexpr chrono::weekday weekday() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

1 weekday_last represents the last weekday of a month.

2 [Note 1: A weekday_last object can be constructed by indexing a weekday with last. — end note]

[Example 1:
constexpr auto wdl = Sunday[last]; // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
— end example]

3 weekday_last is a trivially copyable and standard-layout class type.

29.8.8.2 Member functions

constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

1 Effects: Initializes wd_ with wd.

constexpr chrono::weekday weekday() const noexcept;

2 Returns: wd_.

constexpr bool ok() const noexcept;

3 Returns: wd_.ok().

29.8.8.3 Non-member functions

constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;

1 Returns: x.weekday() == y.weekday().

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);

2 Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[last]"), wdl.weekday());

29.8.9 Class month_day

29.8.9.1 Overview

namespace std::chrono {
    class month_day {
        chrono::month m_; // exposition only
        chrono::day d_; // exposition only
    public:
        month_day() = default;
        constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
    };
}
constexpr chrono::month month() const noexcept;
constexpr chrono::day day() const noexcept;
constexpr bool ok() const noexcept;
}

month_day represents a specific day of a specific month, but with an unspecified year. month_day meets the Cpp17EqualityComparable (Table 28) and Cpp17LessThanComparable (Table 29) requirements.

month_day is a trivially copyable and standard-layout class type.

### 29.8.9.2 Member functions

```cpp
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
Effects: Initializes m_ with m, and d_ with d.
```

```cpp
constexpr chrono::month month() const noexcept;
Returns: m_.
```

```cpp
constexpr chrono::day day() const noexcept;
Returns: d_.
```

```cpp
constexpr bool ok() const noexcept;
Returns: true if m_.ok() is true, 1d <= d_, and d_ is less than or equal to the number of days in month m_; otherwise returns false. When m_ == February, the number of days is considered to be 29.
```

### 29.8.9.3 Non-member functions

```cpp
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
Returns: x.month() == y.month() && x.day() == y.day().
```

```cpp
constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;
Effects: Equivalent to:
```cpp
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day& md);
Effects: Equivalent to:
```cpp
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{}"),
md.month(), md.day());
```

```cpp
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
Effects: Attempts to parse the input stream is into the month_day md using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid month_day, is.setstate(ios_base::failbit) is called and md is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.
Returns: is.
```

### 29.8.10 Class month_day_last

```cpp
namespace std::chrono {
    class month_day_last {
        chrono::month m_; // exposition only
    }
}
```
`month_day_last` represents the last day of a month.

[Note 1: A `month_day_last` object can be constructed using the expression `m/last` or `last/m`, where `m` is an expression of type `month`. — end note]

[Example 1:
```cpp
cconstexpr auto mdl = February/last; // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February); // end example]
```

`month_day_last` is a trivially copyable and standard-layout class type.

```cpp
cconstexpr explicit month_day_last(const chrono::month& m) noexcept;

Effects: Initializes `m_` with `m`.

```

```cpp
cconstexpr month month() const noexcept;

Returns: `m_`.

```

```cpp
cconstexpr bool ok() const noexcept;

Returns: `m_.ok()`.

```

```cpp
cconstexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;

Returns: `x.month() == y.month()`.

```

```cpp
cconstexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;

Returns: `x.month() <=> y.month()`.

```

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
```

Effects: Equivalent to:
```cpp
return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{:L}/last"), mdl.month());
```

### 29.8.11 Class `month_weekday` [time.cal.mwd]

#### 29.8.11.1 Overview [time.cal.mwd.overview]

```cpp
namespace std::chrono {

class month_weekday {

    chrono::month m_; // exposition only
    chrono::weekday_indexed wdi_; // exposition only

    public:
        constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

        constexpr chrono::month month() const noexcept;
        constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
        constexpr bool ok() const noexcept;
    }
}
```

`month_weekday` represents the `n`th weekday of a month, of an as yet unspecified year. To do this the `month_weekday` stores a month and a `weekday_indexed`.

[Example 1:
```cpp
constexpr auto mwd = February/Tuesday[3]; // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
```
static_assert(mwd.weekday_indexed() == Tuesday[3]);
—end example

3 \texttt{\texttt{month\_weekday}} is a trivially copyable and standard-layout class type.

29.8.11.2 Member functions

\begin{verbatim}
constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
\end{verbatim}

\textbf{Effects}: Initializes \texttt{m} with \texttt{m}, and \texttt{wdi} with \texttt{wdi}.

\begin{verbatim}
constexpr chrono::month month() const noexcept;
\end{verbatim}

\textbf{Returns}: \texttt{m}.

\begin{verbatim}
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
\end{verbatim}

\textbf{Returns}: \texttt{wdi}.

\begin{verbatim}
constexpr bool ok() const noexcept;
\end{verbatim}

\textbf{Returns}: \texttt{m}.\texttt{ok}() \&\& \texttt{wdi}.\texttt{ok}().

29.8.11.3 Non-member functions

\begin{verbatim}
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
\end{verbatim}

\textbf{Returns}: \texttt{x.month()} == \texttt{y.month()} \&\& \texttt{x.weekday_indexed()} == \texttt{y.weekday_indexed()}.

\begin{verbatim}
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
\end{verbatim}

\textbf{Effects}: Equivalent to:

\begin{verbatim}
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                         mwd.month(), mwd.weekday_indexed());
\end{verbatim}

29.8.12 Class \texttt{month\_weekday\_last}

29.8.12.1 Overview

\begin{verbatim}
namespace std::chrono {
    class month_weekday_last {
        chrono::month m_; // exposition only
        chrono::weekday_last wdl_; // exposition only
    public:
        constexpr month_weekday_last(const chrono::month& m, const chrono::weekday_last& wdl) noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::weekday_last weekday_last() const noexcept;
        constexpr bool ok() const noexcept;
    }
}
\end{verbatim}

\texttt{\texttt{month\_weekday\_last}} represents the last weekday of a month, of an as yet unspecified year. To do this the \texttt{\texttt{month\_weekday\_last}} stores a \texttt{\texttt{month}} and a \texttt{\texttt{weekday\_last}}.

2 \texttt{\texttt{month\_weekday\_last\_last}} is a trivially copyable and standard-layout class type.
29.8.12.2 Member functions

constexpr month_weekday_last(const chrono::month& m, const chrono::weekday_last& wdl) noexcept;

Effects: Initializes m_ with m, and wdl_ with wdl.

constexpr chrono::month month() const noexcept;

Returns: m_.

constexpr chrono::weekday_last weekday_last() const noexcept;

Returns: wdl_.

constexpr bool ok() const noexcept;

Returns: m_.ok() && wdl_.ok().

29.8.12.3 Non-member functions

constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;

Returns: x.month() == y.month() && x.weekday_last() == y.weekday_last().

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
mwdl.month(), mwdl.weekday_last());

29.8.13 Class year_month

29.8.13.1 Overview

namespace std::chrono {

class year_month {
    chrono::year y_;  // exposition only
    chrono::month m_;  // exposition only

public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;

    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy) noexcept;
    constexpr year_month& operator-=(const years& dy) noexcept;

    constexpr bool ok() const noexcept;
};
}

year_month represents a specific month of a specific year, but with an unspecified day. year_month is
a field-based time point with a resolution of months. year_month meets the Cpp17EqualityComparable
(Table 28) and Cpp17LessThanComparable (Table 29) requirements.

year_month is a trivially copyable and standard-layout class type.

29.8.13.2 Member functions

constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

Effects: Initializes y_ with y, and m_ with m.
constexpr chrono::year year() const noexcept;  
*Returns:* `y_`.  

constexpr chrono::month month() const noexcept;  
*Returns:* `m_`.  

constexpr year_month& operator+=(const months& dm) noexcept;  
*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).  
*Effects:* `*this = *this + dm`.  
*Returns:* `*this`.  

constexpr year_month& operator-=(const months& dm) noexcept;  
*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).  
*Effects:* `*this = *this - dm`.  
*Returns:* `*this`.  

constexpr year_month& operator+=(const years& dy) noexcept;  
*Effects:* `*this = *this + dy`.  
*Returns:* `*this`.  

constexpr year_month& operator-=(const years& dy) noexcept;  
*Effects:* `*this = *this - dy`.  
*Returns:* `*this`.  

constexpr bool ok() const noexcept;  
*Returns:* `y_.ok() && m_.ok()`.  

### 29.8.13.3 Non-member functions

**constexpr bool operator==**(const year_month& x, const year_month& y) noexcept;  
*Returns:* `x.year() == y.year() && x.month() == y.month()`.  

**constexpr strong_ordering operator<=>**(const year_month& x, const year_month& y) noexcept;  
*Effects:* Equivalent to:  

```cpp
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month() <=> y.month();
```

**constexpr year_month operator+(**const year_month& ym, const months& dm) noexcept;  
*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).  
*Returns:* A `year_month` value `z` such that `z.ok() && z - ym == dm` is `true`.  
*Complexity:* $O(1)$ with respect to the value of `dm`.  

**constexpr year_month operator+(**const months& dm, const year_month& ym) noexcept;  
*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).  
*Returns:* `ym + dm`.  

**constexpr year_month operator-**(const year_month& ym, const months& dm) noexcept;  
*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).  
*Returns:* `ym + -dm`.  

§ 29.8.13.3
constexpr months operator-(const year_month& x, const year_month& y) noexcept;

Returns:

\[ x.\text{year}() - y.\text{year}() + \text{months}\{\text{static\_cast<int>(unsigned\{x.\text{month}(\})}) - \text{static\_cast<int>(unsigned\{y.\text{month}(\})})\} \]

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;

Returns: (ym.\text{year}() + dy) / ym.\text{month}().

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;

Returns: ym + dy.

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;

Returns: ym + -dy.

template<class charT, class traits>

basic_ostream<charT, traits>&

operator<<(basic_ostream<charT, traits>& os, const year_month& ym);

Effects: Equivalent to:

\[ \text{return os << format(os.getloc(), STATICALLY-WIDEN<charT>\("{}/\{:L}\"), ym.\text{year}(), ym.\text{month}());} \]

template<class charT, class traits, class Alloc = allocator<charT>>

basic_istream<charT, traits>&

from_stream(basic_istream<charT, traits>& is, const charT* fmt, year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month ym using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year_month, is.setstate(ios_base::failbit) is called and ym is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.14 Class year_month_day

29.8.14.1 Overview

namespace std::chrono {

class year_month_day {

chrono::year y_; // exposition only
chrono::month m_; // exposition only
chrono::day d_; // exposition only

public:

year_month_day() = default;
constexpr year_month_day(const chrono::year& y, const chronon::month& m, const chrono::day& d) noexcept;
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
constexpr year_month_day(const sys_days& dp) noexcept;
constexpr explicit year_month_day(const local_days& dp) noexcept;

constexpr year_month_day& operator+=(const months& m) noexcept;
constexpr year_month_day& operator-=(const months& m) noexcept;
constexpr year_month_day& operator+=(const years& y) noexcept;
constexpr year_month_day& operator-=(const years& y) noexcept;

constexpr chrono::year year() const noexcept;
constexpr chrono::month month() const noexcept;
constexpr chrono::day day() const noexcept;

constexpr operator sys_days() const noexcept;
constexpr explicit operator local_days() const noexcept;

};
constexpr bool ok() const noexcept;
}

year_month_day represents a specific year, month, and day. year_month_day is a field-based time point with a resolution of days.

[Note 1: year_month_day supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_day meets the Cpp17EqualityComparable (Table 28) and Cpp17LessThanComparable (Table 29) requirements.

eyear_month_day is a trivially copyable and standard-layout class type.

29.8.14.2 Member functions

constexpr year_month_day(const chrono::year& y, const chrono::month& m, const chrono::day& d) noexcept;
1 Effects: Initializes y_ with y, m_ with m, and d_ with d.

constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
2 Effects: Initializes y_ with ymdl.year(), m_ with ymdl.month(), and d_ with ymdl.day().

[Note 1: This conversion from year_month_day_last to year_month_day can be more efficient than converting a year_month_day_last to a sys_days, and then converting that sys_days to a year_month_day. — end note]

constexpr year_month_day(const sys_days& dp) noexcept;
3 Effects: Constructs an object of type year_month_day that corresponds to the date represented by dp.

Remarks: For any value ymd of type year_month_day for which ymd.ok() is true, ymd == year_-month_day{sys_days{ymd}} is true.

constexpr explicit year_month_day(const local_days& dp) noexcept;
4 Effects: Equivalent to constructing with sys_days{dp.time_since_epoch()}. 

constexpr year_month_day& operator+=(const months& m) noexcept;
5 Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
6 Effects: *this = *this + m.
7 Returns: *this.

constexpr year_month_day& operator-=(const months& m) noexcept;
8 Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
9 Effects: *this = *this - m.
10 Returns: *this.

constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
11 Effects: *this = *this + y.
12 Returns: *this.

constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
13 Effects: *this = *this - y.
14 Returns: *this.

constexpr chrono::year year() const noexcept;
15 Returns: y_.

constexpr chrono::month month() const noexcept;
16 Returns: m_.

§ 29.8.14.2
constexpr chrono::day day() const noexcept;

Returns: d_.

constexpr operator sys_days() const noexcept;

Returns: If ok() returns a sys_days holding a count of days from the sys_days epoch to *this (a negative value if *this represents a date prior to the sys_days epoch). Otherwise, if y_.ok() && m_.ok() is true, returns sys_days(y_/m_/1d) + (d_ - 1d). Otherwise the value returned is unspecified.

Remarks: A sys_days in the range [days{-12687428}, days{11248737}] which is converted to a year_month_day has the same value when converted back to a sys_days.

[Example 1:
static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
—end example]

castexpr explicit operator local_days() const noexcept;

Returns: local_days{sys_days{*this}.time_since_epoch()}.

castexpr bool ok() const noexcept;

Returns: If y_.ok() is true, and m_.ok() is true, and d_ is in the range [1d, (y_/m_/last).day()], then returns true; otherwise returns false.

§ 29.8.14.3  Non-member functions

castexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;

Returns: x.year() == y.year() && x.month() == y.month() && x.day() == y.day().

castexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;

Effects: Equivalent to:
if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();

castexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: (ymd.year() / ymd.month() + dm) / ymd.day().

[Note 1: If ymd.day() is in the range [1d, 28d], ok() will return true for the resultant year_month_day. —end note]

castexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymd + dm.

castexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymd + (-dm).

castexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;

Returns: (ymd.year() + dy) / ymd.month() / ymd.day().

[Note 2: If ymd.month() is February and ymd.day() is not in the range [1d, 28d], ok() can return false for the resultant year_month_day. —end note]
constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;

Returns: ymd + dy.

customexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;

Returns: ymd + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);

Effects: Equivalent to:

return os << ((ymd.ok() ?
format(STATICALLY-WIDEN<charT>("{:%F}"), ymd) :
format(STATICALLY-WIDEN<charT>("{:F} is not a valid date"), ymd));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month_day ymd using the format flags given in the NTCTS for as specified in 29.13. If the parse fails to decode a valid year_month_day, is.setstate(ios_base::failbit) is called and ymd is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.15 Class year_month_day_last

namespace std::chrono {

class year_month_day_last {

chrono::year y_; // exposition only
chrono::month_day_last mdl_; // exposition only

customexpr year_month_day_last(const chrono::year& y,
const chrono::month_day_last& mdl) noexcept;

customexpr year_month_day_last& operator+=(const months& m) noexcept;
customexpr year_month_day_last& operator-=(const months& m) noexcept;
customexpr year_month_day_last& operator+=(const years& y) noexcept;
customexpr year_month_day_last& operator-=(const years& y) noexcept;

customexpr chrono::year year() const noexcept;
customexpr chrono::month month() const noexcept;
customexpr chrono::month_day_last month_day_last() const noexcept;
customexpr chrono::day day() const noexcept;

customexpr operator sys_days() const noexcept;
customexpr explicit operator local_days() const noexcept;
customexpr bool ok() const noexcept;
};
}

year_month_day_last represents the last day of a specific year and month. year_month_day_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a year and month.

[Note 1: year_month_day_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_day_last meets the Cpp17EqualityComparable (Table 28) and Cpp17LessThanComparable (Table 29) requirements.
2 year_month_day_last is a trivially copyable and standard-layout class type.

29.8.15.2 Member functions

constexpr year_month_day_last(const chrono::year& y,  
const chrono::month_day_last& mdl) noexcept;
   Effects: Initializes y_ with y and mdl_ with mdl.

constexpr year_month_day_last& operator+=(const months& m) noexcept;
   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
   Effects: *this = *this + m.
   Returns: *this.

constexpr year_month_day_last& operator-=(const months& m) noexcept;
   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
   Effects: *this = *this - m.
   Returns: *this.

constexpr year_month_day_last& operator+=(const years& y) noexcept;
   Effects: *this = *this + y.
   Returns: *this.

constexpr year_month_day_last& operator-=(const years& y) noexcept;
   Effects: *this = *this - y.
   Returns: *this.

constexpr chrono::year year() const noexcept;
   Returns: y_.

constexpr chrono::month month() const noexcept;
   Returns: mdl_.month().

constexpr chrono::month_day_last month_day_last() const noexcept;
   Returns: mdl_.

constexpr chrono::day day() const noexcept;
   Returns: If ok() is true, returns a day representing the last day of the (year, month) pair represented by *this. Otherwise, the returned value is unspecified.
   [Note 1: This value might be computed on demand. —end note]

constexpr operator sys_days() const noexcept;
   Returns: sys_days{year()%month()%day()}.  

constexpr explicit operator local_days() const noexcept;
   Returns: local_days{sys_days{*this}.time_since_epoch()}.  

constexpr bool ok() const noexcept;
   Returns: y_.ok() && mdl_.ok().

29.8.15.3 Non-member functions

constexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;
   Returns: x.year() == y.year() && x.month_day_last() == y.month_day_last().

§ 29.8.15.3
constexpr strong_ordering operator<=>(const year_month_day_last& x,  
    const year_month_day_last& y) noexcept;

Effects: Equivalent to:
    if (auto c = x.year() <=> y.year(); c != 0) return c;
    return x.month_day_last() <=> y.month_day_last();

constexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymdl.year() / ymdl.month() + dm) / last.

constexpr year_month_day_last
operator+(const months& dm, const year_month_day_last& ymdl) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymdl + dm.

constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymdl + (-dm).

constexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const years& dy) noexcept;

Returns: {ymdl.year()+dy, ymdl.month_day_last()}.  

constexpr year_month_day_last
operator+(const years& dy, const year_month_day_last& ymdl) noexcept;

Returns: ymdl + dy.

constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const years& dy) noexcept;

Returns: ymdl + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);

Effects: Equivalent to:
    return os << format(os.getloc(), STATICALLY-WIDEN<
charT>("{}/{{:L}}"),
    ymdl.year(), ymdl.month_day_last());

29.8.16 Class year_month_weekday

namespace std::chrono {

class year_month_weekday {
    chrono::year y_; // exposition only
    chrono::month m_; // exposition only
    chrono::weekday_indexed wdi_; // exposition only

    public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,  
        const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;

};
constexpr year_month_weekday& operator+=(const months& m) noexcept;
constexpr year_month_weekday& operator-=(const months& m) noexcept;
constexpr year_month_weekday& operator+=(const years& y) noexcept;
constexpr year_month_weekday& operator-=(const years& y) noexcept;

constexpr chrono::year year() const noexcept;
constexpr chrono::month month() const noexcept;
constexpr chrono::weekday weekday() const noexcept;
constexpr unsigned index() const noexcept;
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
constexpr operator sys_days() const noexcept;
constexpr explicit operator local_days() const noexcept;
constexpr bool ok() const noexcept;

};

1 year_month_weekday represents a specific year, month, and \( n \)th weekday of the month. year_month_weekday is a field-based time point with a resolution of days.

[Note 1: year_month_weekday supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_weekday meets the Cpp17EqualityComparable (Table 28) requirements.

2 year_month_weekday is a trivially copyable and standard-layout class type.

29.8.16.2 Member functions [time.cal.ymwd.members]

constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
   const chrono::weekday_indexed& wdi) noexcept;

1 Effects: Initializes \( y_ \) with \( y \), \( m_ \) with \( m \), and \( wdi_ \) with \( wdi \).

constexpr year_month_weekday(const sys_days& dp) noexcept;

2 Effects: Constructs an object of type year_month_weekday which corresponds to the date represented by \( dp \).

3 Remarks: For any value ymwd of type year_month_weekday for which ymwd.ok() is true, ymwd ==
year_month_weekday{sys_days{ymwd}} is true.

constexpr explicit year_month_weekday(const local_days& dp) noexcept;

4 Effects: Equivalent to constructing with sys_days{dp.time_since_epoch()}.

constexpr year_month_weekday& operator+=(const months& m) noexcept;

5 Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

6 Effects: *this = *this + m.

7 Returns: *this.

constexpr year_month_weekday& operator-=(const months& m) noexcept;

8 Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

9 Effects: *this = *this - m.

10 Returns: *this.

constexpr year_month_weekday& operator+=(const years& y) noexcept;

11 Effects: *this = *this + y.

12 Returns: *this.

constexpr year_month_weekday& operator-=(const years& y) noexcept;

13 Effects: *this = *this - y.

14 Returns: *this.
constexpr chrono::year year() const noexcept;
Returns: y_.

custom chrono::month month() const noexcept;
Returns: m_.

custom chrono::weekday weekday() const noexcept;
Returns: wdi_.weekday().

custom unsigned index() const noexcept;
Returns: wdi_.index().

custom chrono::weekday_indexed weekday_indexed() const noexcept;
Returns: wdi_.

custom operator sys_days() const noexcept;
Returns: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents
the date (index() - 1) * 7 days after the first weekday() of year()/month(). If index() is 0
the returned sys_days represents the date 7 days prior to the first weekday() of year()/month().
Otherwise the returned value is unspecified.

custom explicit operator local_days() const noexcept;
Returns: local_days{sys_days{*this}.time_since_epoch()}. 

custom bool ok() const noexcept;
Returns: If any of y_.ok(), m_.ok(), or wdi_.ok() is false, returns false. Otherwise, if *this
represents a valid date, returns true. Otherwise, returns false.

29.8.16.3 Non-member functions [time.cal.ymwd.nonmembers]

custom bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
Returns: x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()

custom year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Returns: (ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed().

custom year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Returns: ymwd + dm.

custom year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Returns: ymwd + (-dm).

custom year_month_weekday operator+(const year_month_weekday& ymwd, const years& dy) noexcept;
Returns: {ymwd.year() + dy, ymwd.month(), ymwd.weekday_indexed()}. 

custom year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;
Returns: ymwd + dy.

custom year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;
Returns: ymwd + (-dy).
template<class charT, class traits>
    basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);

Effects: Equivalent to:

    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("/{}/{:L}/{:L}"),
    ymwd.year(), ymwd.month(), ymwd.weekday_indexed());

29.8.17 Class year_month_weekday_last

29.8.17.1 Overview

namespace std::chrono {
    class year_month_weekday_last {
        chrono::year y_; // exposition only
        chrono::month m_; // exposition only
        chrono::weekday_last wdl_; // exposition only

        public:
            constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                const chrono::weekday_last& wdl) noexcept;

            constexpr year_month_weekday_last& operator+=(const months& m) noexcept;

            constexpr year_month_weekday_last& operator-=(const months& m) noexcept;

            constexpr year_month_weekday_last& operator+=(const years& y) noexcept;

            constexpr year_month_weekday_last& operator-=(const years& y) noexcept;

            constexpr chrono::year year() const noexcept;

            constexpr chrono::month month() const noexcept;

            constexpr chrono::weekday weekday() const noexcept;

            constexpr chrono::weekday_last weekday_last() const noexcept;

            constexpr operator sys_days() const noexcept;

            constexpr explicit operator local_days() const noexcept;

            constexpr bool ok() const noexcept;
    };

1 year_month_weekday_last represents a specific year, month, and last weekday of the month. year_month_weekday_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last weekday of a year and month.

[Note 1: year_month_weekday_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_weekday_last meets the Cpp17EqualityComparable (Table 28) requirements.

2 year_month_weekday_last is a trivially copyable and standard-layout class type.

29.8.17.2 Member functions

constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
    const chrono::weekday_last& wdl) noexcept;

Effects: Initializes y_ with y, m_ with m, and wdl_ with wdl.

constexpr year_month_weekday_last& operator+=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this + m.

Returns: *this.

constexpr year_month_weekday_last& operator-=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this - m.
Returns: *this.

constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
Effects: *this = *this + y.

Returns: *this.

constexpr year_month_weekday_last& operator-=(const years& y) noexcept;
Effects: *this = *this - y.

Returns: *this.

constexpr chrono::year year() const noexcept;
Returns: y_.

constexpr chrono::month month() const noexcept;
Returns: m_.

constexpr chrono::weekday weekday() const noexcept;
Returns: wdl_.weekday().

constexpr chrono::weekday_last weekday_last() const noexcept;
Returns: wdl_.

constexpr operator sys_days() const noexcept;
Returns: If ok() == true, returns a sys_days that represents the last weekday() of year()/month(). Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;
Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
Returns: y_.ok() && m_.ok() && wdl_.ok().

29.8.17.3 Non-member functions [time.cal.ymwldlast.nonmembers]

constexpr bool operator==(const year_month_weekday_last& x, const year_month_weekday_last& y) noexcept;
Returns: x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last()

constexpr year_month_weekday_last
operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Returns: (ymwdl.year() / ymwdl.month() + dm) / ymwdl.weekday_last().

constexpr year_month_weekday_last
operator+(const months& dm, const year_month_weekday_last& ymwdl) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Returns: ymwdl + dm.

constexpr year_month_weekday_last
operator-(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Returns: ymwdl + (-dm).
constexpr year_month_weekday_last
operator+(const year_month_weekday_last & ymwdl, const years & dy) noexcept;

Returns: \{ymwdl.year()+dy, ymwdl.month(), ymwdl.weekday_last()\}.

cconstexpr year_month_weekday_last
operator+(const years & dy, const year_month_weekday_last & ymwdl) noexcept;

Returns: ymwdl + dy.

cconstexpr year_month_weekday_last
operator-(const year_month_weekday_last & ymwdl, const years & dy) noexcept;

Returns: ymwdl + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);

Effects: Equivalent to:

\[
\text{return os } \ll \text{ format(os.getloc(), STATICALLY-WIDEN}<\text{charT}>("\{}/\{\}\{\}\"),
ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());
\]

29.8.18 Conventional syntax operators [time.cal.operators]

A set of overloaded \texttt{operator/} functions provides a conventional syntax for the creation of civil calendar dates.

[Note 1: The year, month, and day are accepted in any of the following 3 orders:

\texttt{year/month/day}
\texttt{month/day/year}
\texttt{day/month/year}

Anywhere a \texttt{day} is required, any of the following can also be specified:

\texttt{last}
\texttt{weekday[i]}
\texttt{weekday[last]}
— end note]

[Note 2: Partial-date types such as \texttt{year_month} and \texttt{month_day} can be created by not applying the second division operator for any of the three orders. For example:

\texttt{year_month ym = 2015y/April;}
\texttt{month_day md = April/4;}
\texttt{month_day md2 = 4d/April;}
— end note]

[Example 1:

\begin{verbatim}
auto a = 2015/4/4; // a == int(125)
auto b = 2015y/4/4; // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April; // error: no viable operator/ for first /
auto d = 2015/April/4; // error: no viable operator/ for first /
\end{verbatim}
— end example]

constexpr year_month
operator/(const year& y, const month& m) noexcept;

Returns: \{y, m\}.

constexpr year_month
operator/(const year& y, int m) noexcept;

Returns: \texttt{y} / \texttt{month(m)}.

constexpr month_day
operator/(const month& m, const day& d) noexcept;

Returns: \{m, d\}.
constexpr month_day
    operator/(const month& m, int d) noexcept;
    Returns: m / day(d).

constexpr month_day
    operator/(int m, const day& d) noexcept;
    Returns: month(m) / d.

constexpr month_day
    operator/(const day& d, const month& m) noexcept;
    Returns: m / d.

constexpr month_day
    operator/(const day& d, int m) noexcept;
    Returns: month(m) / d.

constexpr month_day_last
    operator/(const month& m, last_spec) noexcept;
    Returns: month_day_last{m}.

constexpr month_day_last
    operator/(int m, last_spec) noexcept;
    Returns: month(m) / last.

constexpr month_day_last
    operator/(last_spec, const month& m) noexcept;
    Returns: m / last.

constexpr month_day_last
    operator/(last_spec, int m) noexcept;
    Returns: month(m) / last.

constexpr month_weekday
    operator/(const month& m, const weekday_indexed& wdi) noexcept;
    Returns: {m, wdi}.

constexpr month_weekday
    operator/(int m, const weekday_indexed& wdi) noexcept;
    Returns: month(m) / wdi.

constexpr month_weekday
    operator/(const weekday_indexed& wdi, const month& m) noexcept;
    Returns: m / wdi.

constexpr month_weekday
    operator/(const weekday_indexed& wdi, int m) noexcept;
    Returns: month(m) / wdi.

constexpr month_weekday_last
    operator/(const month& m, const weekday_last& wdl) noexcept;
    Returns: {m, wdl}.

constexpr month_weekday_last
    operator/(int m, const weekday_last& wdl) noexcept;
    Returns: month(m) / wdl.

constexpr month_weekday_last
    operator/(const weekday_last& wdl, const month& m) noexcept;
    Returns: m / wdl.
constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;

Returns: month(m) / wdl.

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;

Returns: {ym.year(), ym.month(), d}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;
Returns: ym / day(d).

constexpr year_month_day
operator/(const year_month& ym, const month_day& md) noexcept;
Returns: y / md.month() / md.day().

constexpr year_month_day
operator/(const year& y, const month_day& md) noexcept;
Returns: y / md.

constexpr year_month_day
operator/(const month_day& md, const year& y) noexcept;
Returns: y / md.

constexpr year_month_day
operator/(int y, const month_day& md) noexcept;
Returns: year(y) / md.

constexpr year_month_day_last
operator/(const year_month& ym, last_spec) noexcept;
Returns: {ym.year(), month_day_last{ym.month()}}.

constexpr year_month_day_last
operator/(const year& y, const month_day_last& mdl) noexcept;
Returns: {y, mdl}.

constexpr year_month_day_last
operator/(int y, const month_day_last& mdl) noexcept;
Returns: year(y) / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, const year& y) noexcept;
Returns: y / mdl.

constexpr year_month_weekday
operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
Returns: {ym.year(), ym.month(), wdi}.

constexpr year_month_weekday
operator/(const year_month& ym, const month_weekday& mwd) noexcept;
Returns: {y, mwd.month(), mwd.weekday_indexed()}. 

constexpr year_month_weekday
operator/(int y, const month_weekday& mwd) noexcept;
Returns: year(y) / mwd.
constexpr year_month_weekday
operator/(const month_weekday& mwd, const year& y) noexcept;
Returns: y / mwd.

constexpr year_month_weekday
operator/(const month_weekday& mwd, int y) noexcept;
Returns: year(y) / mwd.

constexpr year_month_weekday_last
operator/(const year_month_weekday_last& ym, const weekday_last& wdl) noexcept;
Returns: {ym.year(), ym.month(), wdl}.

constexpr year_month_weekday_last
operator/(const year& y, const month_weekday_last& mwdl) noexcept;
Returns: {y, mwdl.month(), mwdl.weekday_last()}.

constexpr year_month_weekday_last
operator/(int y, const month_weekday_last& mwdl) noexcept;
Returns: year(y) / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, const year& y) noexcept;
Returns: y / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, int y) noexcept;
Returns: year(y) / mwdl.

29.9 Class template hh_mm_ss

namespace std::chrono {
    template<class Duration> class hh_mm_ss {
        public:
            static constexpr unsigned fractional_width = see below;
            using precision = see below;

            constexpr hh_mm_ss() noexcept : hh_mm_ss(Duration::zero()) {} // exposition only
            constexpr explicit hh_mm_ss(Duration d);

            constexpr bool is_negative() const noexcept;
            constexpr chrono::hours hours() const noexcept;
            constexpr chrono::minutes minutes() const noexcept;
            constexpr chrono::seconds seconds() const noexcept;
            constexpr precision subseconds() const noexcept;
            constexpr explicit operator precision() const noexcept;
            constexpr precision to_duration() const noexcept;

        private:
            bool is_neg; // exposition only
            chrono::hours h; // exposition only
            chrono::minutes m; // exposition only
            chrono::seconds s; // exposition only
            precision ss; // exposition only
    };
}

1 The hh_mm_ss class template splits a duration into a multi-field time structure hours:minutes:seconds and possibly subseconds, where subseconds will be a duration unit based on a non-positive power of 10. The Duration template parameter dictates the precision to which the time is split. A hh_mm_ss models negative durations with a distinct is_negative getter that returns true when the input duration is negative. The
individual duration fields always return non-negative durations even when \texttt{is\_negative()} indicates the structure is representing a negative duration.

2 If \texttt{Duration} is not a specialization of \texttt{duration}, the program is ill-formed.

29.9.2 Members

\begin{verbatim}
static constexpr unsigned fractional_width = see below;

fractional_width is the number of fractional decimal digits represented by \texttt{precision}. fractional_width has the value of the smallest possible integer in the range [0, 18] such that \texttt{precision} will exactly represent all values of \texttt{Duration}. If no such value of fractional_width exists, then fractional_width is 6.

[Example 1: See Table 100 for some durations, the resulting fractional_width, and the formatted fractional second output of Duration{1}.

\begin{table}
\begin{tabular}{|c|c|c|}
\hline
Duration & fractional_width & Formatted fractional second output \\
\hline
hours, minutes, and seconds & 0 & 0.001 \\
milliseconds & 3 & 0.000001 \\
microseconds & 6 & 0.000000001 \\
nanoseconds & 9 & 0.00000000001 \\
duration<int, ratio<1, 2>> & 1 & 0.5 \\
duration<int, ratio<1, 3>> & 6 & 0.333333 \\
duration<int, ratio<1, 4>> & 2 & 0.25 \\
duration<int, ratio<1, 5>> & 1 & 0.2 \\
duration<int, ratio<1, 6>> & 6 & 0.166666 \\
duration<int, ratio<1, 7>> & 6 & 0.142857 \\
duration<int, ratio<1, 8>> & 3 & 0.125 \\
duration<int, ratio<1, 9>> & 6 & 0.111111 \\
duration<int, ratio<1, 10>> & 1 & 0.1 \\
duration<int, ratio<756, 625>> & 4 & 0.209661 \\
\hline
\end{tabular}
\caption{Examples for fractional_width} 
\end{table}

\textit{— end example}]

using precision = see below;

precision is

duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, 10^{\text{fractional_width}}> 

constexpr explicit hh_mm_ss(Duration d);

Effects: Constructs an object of type \texttt{hh_mm_ss} which represents the \texttt{Duration} \texttt{d} with precision \texttt{precision}.

\begin{itemize}
\item \texttt{(3.1)} \texttt{is\_neg} initialized with \texttt{d < Duration::zero()}.
\item \texttt{(3.2)} \texttt{hours} initialized with \texttt{duration\_cast<chrono::hours>(abs(d))}.
\item \texttt{(3.3)} \texttt{minutes} initialized with \texttt{duration\_cast<chrono::minutes>(abs(d) - hours())}.
\item \texttt{(3.4)} \texttt{seconds} initialized with \texttt{duration\_cast<chrono::seconds>(abs(d) - hours() - minutes())}.
\item \texttt{(3.5)} If \texttt{treat\_as\_floating\_point_v<precision::rep>} is \texttt{true}, initializes \texttt{ss} with \texttt{abs(d) - hours()} - \texttt{minutes()} - \texttt{seconds()}. Otherwise, initializes \texttt{ss} with \texttt{duration\_cast<precision>(abs(d) - hours() - minutes() - seconds())}.
\end{itemize}

[Note 1: When \texttt{precision::rep} is integral and \texttt{precision::period} is \texttt{ratio<1>}, \texttt{subseconds()} always returns a value equal to 0s. \textit{— end note}]

Postconditions: If \texttt{treat\_as\_floating\_point_v<precision::rep>} is \texttt{true}, \texttt{to\_duration()} returns \texttt{d}, otherwise \texttt{to\_duration()} returns \texttt{duration\_cast<precision>(d)}.

constexpr bool is\_negative() const noexcept;

Returns: \texttt{is\_neg}.
\end{verbatim}
constexpr chrono::hours hours() const noexcept;

Returns: h.

constexpr chrono::minutes minutes() const noexcept;

Returns: m.

constexpr chrono::seconds seconds() const noexcept;

Returns: s.

constexpr precision subseconds() const noexcept;

Returns: ss.

constexpr precision to_duration() const noexcept;

Returns: If is_neg, returns -(h + m + s + ss), otherwise returns h + m + s + ss.

constexpr explicit operator precision() const noexcept;

Returns: to_duration().

29.9.3 Non-members

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);

Effects: Equivalent to:

return os << format(os.getloc(), "{:L%T}", hms);

[Example 1:
for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
    hh_mm_ss hms{ms};
    cout << hms << 'n';
}

Produces the output (assuming the 'C' locale):
-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45
— end example]

29.10 12/24 hours functions

These functions aid in translating between a 12h format time of day and a 24h format time of day.

constexpr bool is_am(const hours& h) noexcept;

Returns: 0h <= h && h <= 11h.

constexpr bool is_pm(const hours& h) noexcept;

Returns: 12h <= h && h <= 23h.

constexpr hours make12(const hours& h, bool is_pm) noexcept;

Returns: The 12-hour equivalent of h in the range [1h, 12h]. If h is not in the range [0h, 23h], the value returned is unspecified.

constexpr hours make24(const hours& h, bool is_pm) noexcept;

Returns: If is_pm is false, returns the 24-hour equivalent of h in the range [0h, 11h], assuming h represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of h in the range [12h, 23h], assuming h represents a post meridiem hour. If h is not in the range [1h, 12h], the value returned is unspecified.

§ 29.10 1573
29.11 Time zones

29.11.1 In general

29.11 describes an interface for accessing the IANA Time Zone Database that interoperates with \texttt{sys\_time} and \texttt{local\_time}. This interface provides time zone support to both the civil calendar types (29.8) and to user-defined calendars.

29.11.2 Time zone database

29.11.2.1 Class \texttt{tzdb}

namespace std::chrono {
  struct tzdb {
    string version;
    vector<time_zone> zones;
    vector<time_zone_link> links;
    vector<leap_second> leap_seconds;
    
    const time_zone* locate_zone(string_view tz_name) const;
    const time_zone* current_zone() const;
  };
}

1 Each \texttt{vector} in a \texttt{tzdb} object is sorted to enable fast lookup.

const time_zone* locate_zone(string_view tz_name) const;

2 Returns:

(2.1) If \texttt{zones} contains an element \texttt{tz} for which \texttt{tz.name()} == \texttt{tz\_name}, a pointer to \texttt{tz};

(2.2) otherwise, if \texttt{links} contains an element \texttt{tz\_l} for which \texttt{tz\_l.name()} == \texttt{tz\_name}, then a pointer to the element \texttt{tz} of \texttt{zones} for which \texttt{tz.name()} == \texttt{tz\_l.target()}.

[Note 1: A \texttt{time\_zone\_link} specifies an alternative name for a \texttt{time\_zone}. — end note]

3 Throws: If a const time_zone* cannot be found as described in the Returns: element, throws a \texttt{runtime\_error}.

[Note 2: On non-exceptional return, the return value is always a pointer to a valid time_zone. — end note]

const time_zone* current_zone() const;

4 Returns: A pointer to the time zone which the computer has set as its local time zone.

29.11.2.2 Class \texttt{tzdb\_list}

namespace std::chrono {
  class tzdb_list {
    public:
    tzdb_list(const tzdb_list&) = delete;
    tzdb_list& operator=(const tzdb_list&) = delete;
    
    // unspecified additional constructors
    class const_iterator;
    
    const tzdb& front() const noexcept;
    const_iterator erase_after(const_iterator p);
    const_iterator begin() const noexcept;
    const_iterator end() const noexcept;
    const_iterator cbegin() const noexcept;
    const_iterator cend() const noexcept;
  };
}

1 The \texttt{tzdb\_list} database is a singleton; the unique object of type \texttt{tzdb\_list} can be accessed via the \texttt{get\_tzdb\_list()} function.

§ 29.11.2.2
The `tzdb_list` object contains a list of `tzdb` objects. const `tzdb_list::const_iterator` is a constant iterator which meets the `Cpp17ForwardIterator` requirements and has a value type of `tzdb`.

const `tzdb& front()` const noexcept;

*Synchronization:* This operation is thread-safe with respect to `reload_tzdb()`.

[Note 2: `reload_tzdb()` pushes a new `tzdb` onto the front of this container. — end note]

Returns: A reference to the first `tzdb` in the container.

const_iterator erase_after(const_iterator p);

*Preconditions:* The iterator following `p` is dereferenceable.

*Effects:* Erases the `tzdb` referred to by the iterator following `p`.

*Postconditions:* No pointers, references, or iterators are invalidated except those referring to the erased `tzdb`.

[Note 3: It is not possible to erase the `tzdb` referred to by `begin()`. — end note]

Returns: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

*Throws:* Nothing.

const_iterator begin() const noexcept;

Returns: An iterator referring to the first `tzdb` in the container.

const_iterator end() const noexcept;

Returns: An iterator referring to the position one past the last `tzdb` in the container.

const_iterator cbegin() const noexcept;

Returns: `begin()`.

const_iterator cend() const noexcept;

Returns: `end()`.

§ 29.11.2.3 Time zone database access

`tzdb_list& get_tzdb_list();`

*Effects:* If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.

*Synchronization:* It is safe to call this function from multiple threads at one time.

*Returns:* A reference to the database.

*Throws:* `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdb`s.

`const tzdb& get_tzdb();`

*Returns:* `get_tzdb_list().front()`.

`const time_zone* locate_zone(string_view tz_name);`

*Returns:* `get_tzdb().locate_zone(tz_name)`.

[Note 1: The time zone database will be initialized if this is the first reference to the database. — end note]

`const time_zone* current_zone();`

*Returns:* `get_tzdb().current_zone()`.
29.11.2.4 Remote time zone database support

The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the remote time zone database.

```cpp
const tzdb& reload_tzdb();
```

**Effects:** This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.

**Synchronization:** This function is thread-safe with respect to `get_tzdb_list().front()` and `get_tzdb_list().erase_after()`.

**Postconditions:** No pointers, references, or iterators are invalidated.

**Returns:** `get_tzdb_list().front()`.

**Throws:** `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```cpp
string remote_version();
```

**Returns:** The latest remote database version.

[Note 1: This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent. — end note]

29.11.3 Exception classes

29.11.3.1 Class `nonexistent_local_time`

```cpp
namespace std::chrono {
    class nonexistent_local_time : public runtime_error {
        template<class Duration>
        nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    }
}
```

**nonexistent_local_time** is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```cpp
template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
```

**Preconditions:** `i.result == local_info::nonexistent` is true.

**Effects:** Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```cpp
ostringstream os;
os << tp << " is in a gap between\n"
    << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ', '
    << i.first.abbrev << " and\n"
    << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ', '
    << i.second.abbrev
    << " which are both equivalent to\n"
    << i.first.end << " UTC";
```

[Example 1:

```cpp
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time("America/New_York",
            local_days{Sunday[2]/March/2016} + 2h + 30min);
```
catch (const nonexistent_local_time& e) {
    std::cout << e.what() << '\n';
}

Produces the output:

2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC

— end example]

29.11.3.2 Class ambiguous_local_time

namespace std::chrono {
    class ambiguous_local_time : public runtime_error {
        public:
            template<class Duration>
            ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}

ambiguous_local_time is thrown when an attempt is made to convert an ambiguous local_time to a
sys_time without specifying choose::earliest or choose::latest.

template<class Duration>
ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);

Preconditions: i.result == local_info::ambiguous
is true.

Effects: Initializes the base class with a sequence of char equivalent to that produced by os.str() initialized as shown below:

    ostringstream os;
    os << tp << " is ambiguous. It could be\n    " << tp << ' ' << i.first.abbrev << " == "
    << tp - i.first.offset << " UTC or\n    " << tp << ' ' << i.second.abbrev << " == "
    << tp - i.second.offset << " UTC";

[Example 1:

#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time("America/New_York",
            local_days{Sunday[1]/November/2016} + 1h + 30min);
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '\n';
    }
}

Produces the output:

2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC

— end example]

29.11.4 Information classes

29.11.4.1 Class sys_info

namespace std::chrono {
    struct sys_info {
        sys_seconds begin;
    }

§ 29.11.4.1 1577
A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.

[Note 1: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly. — end note]

The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range `[begin,end)`. This information can be used to efficiently iterate the transitions of a `time_zone`.

The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

\[
\text{offset} = \text{local_time} - \text{sys_time}
\]

The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0` min, this `sys_info` is said to be on “daylight saving” time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0` min. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin,end)` (if `save != 0` min for this `sys_info`).

The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

\[
\text{offset} = \text{local_time} - \text{sys_time}
\]

The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0` min, this `sys_info` is said to be on “daylight saving” time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0` min. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin,end)` (if `save != 0` min for this `sys_info`).

The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

\[
\text{offset} = \text{local_time} - \text{sys_time}
\]

The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0` min, this `sys_info` is said to be on “daylight saving” time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0` min. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin,end)` (if `save != 0` min for this `sys_info`).

The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

\[
\text{offset} = \text{local_time} - \text{sys_time}
\]

The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0` min, this `sys_info` is said to be on “daylight saving” time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0` min. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin,end)` (if `save != 0` min for this `sys_info`).

Describes the result of converting a `local_time` to a `sys_time` as follows:

(2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.

(2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that begins just after the `local_time`, and `second` will be filled out with the `sys_info` that ends just prior to the `local_time`.

(2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

§ 29.11.4.2
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);

Effects: Streams out the local_info object r in an unspecified format.

Returns: os.

29.11.5 Class time_zone

29.11.5.1 Overview

namespace std::chrono {

class time_zone {
public:

time_zone(time_zone&&) = default;
time_zone& operator=(time_zone&&) = default;

// unspecified additional constructors

string_view name() const noexcept;

// unspecified additional constructors

template<class Duration> sys_info get_info(const sys_time<Duration>& st) const;
template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
to_sys(const local_time<Duration>& tp) const;

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
to_sys(const local_time<Duration>& tp, choose z) const;

template<class Duration>
local_time<common_type_t<Duration, seconds>>
to_local(const sys_time<Duration>& tp) const;
};
}

A time_zone represents all time zone transitions for a specific geographic area. time_zone construction is unspecified, and performed as part of database initialization.

[Note 1: const time_zone objects can be accessed via functions such as locate_zone. — end note]

29.11.5.2 Member functions

string_view name() const noexcept;

Returns: The name of the time_zone.

[Example 1: "America/New_York". — end example]

template<class Duration>
sys_info get_info(const sys_time<Duration>& st) const;

Returns: A sys_info i for which st is in the range [i.begin, i.end).

template<class Duration>
local_info get_info(const local_time<Duration>& tp) const;

Returns: A local_info for tp.

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
to_sys(const local_time<Duration>& tp) const;

Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone.

Throws: If the conversion from tp to a sys_time is ambiguous, throws ambiguous_local_time. If the tp represents a non-existent time between two UTC time_points, throws nonexistent_local_time.
template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
to_sys(const local_time<Duration>& tp, choose z) const;

    Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has
finer precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone. If the conversion from tp to a sys_time is ambiguous, returns the earlier sys_time if z ==
choose::earliest, and returns the later sys_time if z == choose::latest. If the tp represents a
non-existant time between two UTC time_points, then the two UTC time_points will be the same,
and that UTC time_point will be returned.

template<class Duration>
    local_time<common_type_t<Duration, seconds>>
to_local(const sys_time<Duration>& tp) const;

    Returns: The local_time associated with tp and this time_zone.

29.11.5.3 Non-member functions

bool operator==(const time_zone& x, const time_zone& y) noexcept;

    Returns: x.name() == y.name().

strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;

    Returns: x.name() <=> y.name().

29.11.6 Class template zoned_traits

namespace std::chrono {
    template<class T> struct zoned_traits {};
}

zoned_traits provides a means for customizing the behavior of zoned_time<Duration, TimeZonePtr>
for the zoned_time default constructor, and constructors taking string_view. A specialization for const
time_zone* is provided by the implementation:

namespace std::chrono {
    template<> struct zoned_traits<const time_zone*> {
        static const time_zone* default_zone();
        static const time_zone* locate_zone(string_view name);
    };
}

static const time_zone* default_zone();

    Returns: std::chrono::locate_zone("UTC").

static const time_zone* locate_zone(string_view name);

    Returns: std::chrono::locate_zone(name).

29.11.7 Class template zoned_time

29.11.7.1 Overview

namespace std::chrono {
    template<class Duration, class TimeZonePtr = const time_zone*>
class zoned_time {
public:
    using duration = common_type_t<Duration, seconds>;

private:
    TimeZonePtr zone_;       // exposition only
    sys_time<duration> tp_;   // exposition only

    using traits = zoned_traits<TimeZonePtr>;  // exposition only

public:
    zoned_time();
    zoned_time(const zoned_time&) = default;
zoned_time& operator=(const zoned_time&) = default;

zoned_time(const sys_time<Duration>& st);
explicit zoned_time(TimeZonePtr z);
explicit zoned_time(string_view name);

template<class Duration2>
    zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);

zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
zoned_time(string_view name, const sys_time<Duration>& st);

zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
zoned_time(string_view name, const local_time<Duration>& tp);

zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
zoned_time(string_view name, const local_time<Duration>& tp, choose c);

template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);

template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);

template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

zoned_time& operator=(const sys_time<Duration>& st);
zoned_time& operator=(const local_time<Duration>& lt);

operator sys_time<duration>() const;
explicit operator local_time<duration>() const;

TimeZonePtr get_time_zone() const;
local_time<duration> get_local_time() const;
sys_time<duration> get_sys_time() const;
sys_info get_info() const;

zoned_time() -> zoned_time<seconds>);

template<class Duration>
    zoned_time(sys_time<Duration>)
        -> zoned_time<common_type_t<Duration, seconds>>;

template<class TimeZonePtrOrName>
using time-zone-representation =
    conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
        const time_zone*,
        remove_cvref_t<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName>
    zoned_time(TimeZonePtrOrName&&)
        -> zoned_time<seconds, time-zone-representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
    zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
        -> zoned_time<common_type_t<Duration, seconds>,
            time-zone-representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
    zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
        choose = choose::earliest)
        -> zoned_time<common_type_t<Duration, seconds>,
            time-zone-representation<TimeZonePtrOrName>>;

§ 29.11.7.1
time-zone-representation<TimeZonePtrOrName>>;

template<class Duration, class TimeZonePtrOrName, class TimeZonePtr2>
zoned_time(TimeZonePtrOrName&&, zoned_time<Duration, TimeZonePtr2>,
  choose = choose::earliest)
  -> zoned_time<common_type_t<Duration, seconds>,
    time-zone-representation<TimeZonePtrOrName>>;
}

1. zoned_time represents a logical pairing of a time_zone and a time_point with precision Duration. zoned_time<Duration> maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

2. If Duration is not a specialization of chrono::duration, the program is ill-formed.

3. Every constructor of zoned_time that accepts a string_view as its first parameter does not participate in class template argument deduction (12.2.2.9).

29.11.7.2 Constructors

zoned_time();

1. Constraints: traits::default_zone() is a well-formed expression.

2. Effects: Initializes zone_ with traits::default_zone() and default constructs tp_.

zoned_time(const sys_time<Duration>& st);

3. Constraints: traits::default_zone() is a well-formed expression.

4. Effects: Initializes zone_ with traits::default_zone() and tp_ with st.

explicit zoned_time(TimeZonePtr z);

5. Preconditions: z refers to a time zone.

6. Effects: Initializes zone_ with std::move(z) and default constructs tp_.

explicit zoned_time(string_view name);

7. Constraints: traits::locate_zone(string_view{}) is a well-formed expression and zoned_time is constructible from the return type of traits::locate_zone(string_view{}).

8. Effects: Initializes zone_ with traits::locate_zone(name) and default constructs tp_.

template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);

9. Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.

10. Effects: Initializes zone_ with y.zone_ and tp_ with y.tp_.

zoned_time(TimeZonePtr z, const sys_time<Duration>& st);

11. Preconditions: z refers to a time zone.

12. Effects: Initializes zone_ with std::move(z) and tp_ with st.

zoned_time(string_view name, const sys_time<Duration>& st);

13. Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and st.

14. Effects: Equivalent to construction with {traits::locate_zone(name), st}.

zoned_time(TimeZonePtr z, const local_time<Duration>& tp);

15. Constraints:

   is_convertible_v<
    decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>())>,
    sys_time<duration>>
   
   is true.

16. Preconditions: z refers to a time zone.
Effects: Initializes zone_ with std::move(z) and tp_ with zone_->to_sys(tp).

```
zoned_time(string_view name, const local_time<Duration>& tp);
```

Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and tp.

Effects: Equivalent to construction with {traits::locate_zone(name), tp}.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

Constraints:

```
is_convertible_v<
decltype(declval<TimeZonePtr&>{}->to_sys(local_time<Duration>{}, choose::earliest)),
sys_time<duration>>
```

is true.

Preconditions: z refers to a time zone.

Effects: Initializes zone_ with std::move(z) and tp_ with zone_->to_sys(tp, c).

```
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

Constraints: zoned_time is constructible from the return type of traits::locate_zone(name), local_time<Duration>, and choose.

Effects: Equivalent to construction with {traits::locate_zone(name), tp, c}.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.

Preconditions: z refers to a valid time zone.

Effects: Initializes zone_ with std::move(z) and tp_ with y.tp_.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.

Preconditions: z refers to a valid time zone.

Effects: Equivalent to construction with {z, y}.

[Note 1: The choose parameter has no effect. —end note]

```
template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
```

Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and the type zoned_time<Duration2, TimeZonePtr2>.

Effects: Equivalent to construction with {traits::locate_zone(name), y}.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const timeZone<Duration2, TimeZonePtr2>& y, choose c);
```

Constraints: zoned_time is constructible from the return type of traits::locate_zone(name), the type zoned_time<Duration2, TimeZonePtr2>, and the type choose.

Effects: Equivalent to construction with {traits::locate_zone(name), y, c}.

[Note 2: The choose parameter has no effect. —end note]

### 29.11.7.3 Member functions

```
zoned_time& operator=(const sys_time<Duration>& st);
```

Effects: After assignment, get_sys_time() == st. This assignment has no effect on the return value of get_time_zone().

Returns: *this.

zoned_time& operator=(const local_time<Duration>& lt);

Effects: After assignment, get_local_time() == lt. This assignment has no effect on the return value of get_time_zone().

Returns: *this.

operator sys_time<duration>() const;

Returns: get_sys_time().

explicit operator local_time<duration>() const;

Returns: get_local_time().

TimeZonePtr get_time_zone() const;

Returns: zone_.

local_time<duration> get_local_time() const;

Returns: zone_->to_local(tp_).

sys_time<duration> get_sys_time() const;

Returns: tp_.

sys_info get_info() const;

Returns: zone_->get_info(tp_).

29.11.7.4 Non-member functions

template<class Duration1, class Duration2, class TimeZonePtr>
bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
const zoned_time<Duration2, TimeZonePtr>& y);

Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
const zoned_time<Duration, TimeZonePtr>& t);

Effects: Equivalent to:
return os << format(os.getloc(), "{:L%F %T %Z}"), t);

29.11.8 Class leap_second

29.11.8.1 Overview

Objects of type leap_second representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

[Example 1:
for (auto& l : get_tzdb().leap_seconds)
if (l <= 2018y/March/17d)
cout << l.date() << "::" << l.value() << \
];
Produces the output:

```
1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
1994-07-01 00:00:00: 1s
1996-01-01 00:00:00: 1s
1997-07-01 00:00:00: 1s
1999-01-01 00:00:00: 1s
2006-01-01 00:00:00: 1s
2009-01-01 00:00:00: 1s
2012-07-01 00:00:00: 1s
2015-07-01 00:00:00: 1s
2017-01-01 00:00:00: 1s
```

— end example

29.11.8.2 Member functions

```cpp
constexpr sys_seconds date() const noexcept;
```

Returns: The date and time at which the leap second was inserted.

```cpp
constexpr seconds value() const noexcept;
```

Returns: `+1s` to indicate a positive leap second or `-1s` to indicate a negative leap second.

[Note 1: All leap seconds inserted up through 2022 were positive leap seconds. — end note]

29.11.8.3 Non-member functions

```cpp
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

Returns: `x.date() == y.date()`.

```cpp
constexpr strong_ordering operator<=>(const leap_second& x, const leap_second& y) noexcept;
```

Returns: `x.date() <=> y.date()`.

```cpp
template<class Duration>
constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

Returns: `x.date() == y`.

```cpp
template<class Duration>
constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

Returns: `x.date() < y`.

```cpp
template<class Duration>
constexpr bool operator<(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

Returns: `x < y.date()`.

§ 29.11.8.3
template<class Duration>
constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;

Returns: y < x.

template<class Duration>
constexpr bool operator>(const sys_time<Duration>& x, const leap_second& y) noexcept;

Returns: !(y < x).

(template<class Duration>
constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;

Returns: !(y < x).

(template<class Duration>
constexpr bool operator<=(const sys_time<Duration>& x, const leap_second& y) noexcept;

Returns: !(x < y).

(template<class Duration>
constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;

Returns: !(x < y).

(template<class Duration>
constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;

Returns: !(x < y).

requires three_way_comparable_with<sys_seconds, sys_time<Duration>>

constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;

Returns: x.name() <=> y.

29.11.9 Class time_zone_link

29.11.9.1 Overview

namespace std::chrono {
    class time_zone_link {
        public:
            time_zone_link(time_zone_link&&) = default;
            time_zone_link& operator=(time_zone_link&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;
            string_view target() const noexcept;
    };
}

A time_zone_link specifies an alternative name for a time_zone. time_zone_links are constructed when
the time zone database is initialized.

29.11.9.2 Member functions

string_view name() const noexcept;

Returns: The alternative name for the time zone.

string_view target() const noexcept;

Returns: The name of the time_zone for which this time_zone_link provides an alternative name.

29.11.9.3 Non-member functions

bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;

Returns: x.name() == y.name().
strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;

Returns: x.name() <=> y.name().

29.12 Formatting

Each formatter (22.14.6) specialization in the chrono library (29.2) meets the Formatter requirements (22.14.6.1). The parse member functions of these formatters interpret the format specification as a chrono-format-spec according to the following syntax:

chrono-format-spec:
  fill-and-align opt width opt precision opt L opt chrono-specs opt
chrono-specs:
  conversion-spec
  chrono-specs conversion-spec
  chrono-specs literal-char

literal-char:
  any character other than {, }, or %

conversion-spec:
  % modifier opt type

modifier:
  one of
  E O

modifier:
  one of
  a A b B c C d D e E f F g G h H j j m M n
  p Q r R s S t T u U v V w W x X y Y z Z %

The productions fill-and-align, width, and precision are described in 22.14.2. Giving a precision specification in the chrono-format-spec is valid only for types that are specializations of std::chrono::duration for which the nested typedef-name rep denotes a floating-point type. For all other types, an exception of type format_error is thrown if the chrono-format-spec contains a precision specification. All ordinary multibyte characters represented by literal-char are copied unchanged to the output.

2 A formatting locale is an instance of locale used by a formatting function, defined as
(2.1) — the "C" locale if the L option is not present in chrono-format-spec, otherwise
(2.2) — the locale passed to the formatting function if any, otherwise
(2.3) — the global locale.

Each conversion specifier conversion-spec is replaced by appropriate characters as described in Table 101; the formats specified in ISO 8601:2004 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding. If the formatted object does not contain the information the conversion specifier refers to, an exception of type format_error is thrown.

4 The result of formatting a std::chrono::duration instance holding a negative value, or an hh_mm_ss object h for which h.is_negative() is true, is equivalent to the output of the corresponding positive value, with a STATICALLY-WIDEN<charT>("-") character sequence placed before the replacement of the initial conversion specifier.

[Example 1:]
  cout << format("{:%T}", -10'000s); // prints: -02:46:40
  cout << format("{:%H:%M:%S}", -10'000s); // prints: -02:46:40
  cout << format("minutes {:%M, hours %H, seconds %S}", -10'000s); // prints: minutes -46, hours 02, seconds 40

— end example]

5 Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers %Z and %z will format this information (respectively).

[Note 1: If the information is not available and a %Z or %z conversion specifier appears in the chrono-format-spec, an exception of type format_error is thrown, as described above. — end note]
If the type being formatted does not contain the information that the format flag needs, an exception of type `format_error` is thrown.

**Example 2**: A `duration` does not contain enough information to format as a `weekday`. —end example

However, if a flag refers to a “time of day” (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>The locale’s abbreviated weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td>%A</td>
<td>The locale’s full weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td>%b</td>
<td>The locale’s abbreviated month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td>%B</td>
<td>The locale’s full month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td>%c</td>
<td>The locale’s date and time representation. The modified command <code>%Ec</code> produces the locale’s alternate date and time representation.</td>

</tr>
<tr>
<td>%r</td>
<td>The locale’s 12-hour clock time.</td>
</tr>
<tr>
<td>%R</td>
<td>Equivalent to <code>%H:%M</code>.</td>
</tr>
</tbody>
</table>
Table 101: Meaning of conversion specifiers (continued)

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%S</td>
<td>Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %OS produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%t</td>
<td>A horizontal-tab character.</td>
</tr>
<tr>
<td>%T</td>
<td>Equivalent to %H:%M:%S.</td>
</tr>
<tr>
<td>%u</td>
<td>The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %Ou produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%U</td>
<td>The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OU produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%V</td>
<td>The ISO week-based week number as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OV produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%w</td>
<td>The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Ow produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%W</td>
<td>The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OW produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%x</td>
<td>The locale’s date representation. The modified command %Ex produces the locale’s alternate date representation.</td>
</tr>
<tr>
<td>%X</td>
<td>The locale’s time representation. The modified command %EX produces the locale’s alternate time representation.</td>
</tr>
<tr>
<td>%y</td>
<td>The last two decimal digits of the year. If the result is a single digit it is prefixed by 0. The modified command %Oy produces the locale’s alternative representation. The modified command %Ey produces the locale’s alternative representation of offset from %EC (year only).</td>
</tr>
<tr>
<td>%Y</td>
<td>The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits. The modified command %EY produces the locale’s alternative full year representation.</td>
</tr>
<tr>
<td>%z</td>
<td>The offset from UTC in the ISO 8601:2004 format. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands %Ez and %Oz insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type format_error is thrown.</td>
</tr>
<tr>
<td>%Z</td>
<td>The time zone abbreviation. If the time zone abbreviation is not available, an exception of type format_error is thrown.</td>
</tr>
<tr>
<td>%</td>
<td>A % character.</td>
</tr>
</tbody>
</table>

7 If the chrono-specs is omitted, the chrono object is formatted as if by streaming it to basic_ostringstream<charT> os with the formatting locale imbued and copying os.str() through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

[Example 3]:

```cpp
string s = format("{:=8}", 42ms); // value of s is "====42ms"
--- end example
```

8 Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted.
template<class Duration, class charT>
struct formatter<chrono::utc_time<Duration>, charT>;

Remarks: If %Z is used, it is replaced with \texttt{STATICALLY-WIDEN<charT>("UTC")}. If %z (or a modified variant of %z) is used, an offset of 0\,\text{min} is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is \texttt{STATICALLY-WIDEN<charT>("60")}.

template<class Duration, class charT>
struct formatter<chrono::tai_time<Duration>, charT>;

Remarks: If %Z is used, it is replaced with \texttt{STATICALLY-WIDEN<charT>("TAI")}. If %z (or a modified variant of %z) is used, an offset of 0\,\text{min} is formatted. The date and time formatted are equivalent to those formatted by a \texttt{sys_time} initialized with

\begin{equation}
\text{sys_time<Duration>}(\text{tp.time_since_epoch()}) - (\text{sys_days\{1970y/January/1\}} - \text{sys_days\{1958y/January/1\}})
\end{equation}

template<class Duration, class charT>
struct formatter<chrono::gps_time<Duration>, charT>;

Remarks: If %Z is used, it is replaced with \texttt{STATICALLY-WIDEN<charT>("GPS")}. If %z (or a modified variant of %z) is used, an offset of 0\,\text{min} is formatted. The date and time formatted are equivalent to those formatted by a \texttt{sys_time} initialized with

\begin{equation}
\text{sys_time<Duration>}(\text{tp.time_since_epoch()}) + (\text{sys_days\{1980y/January/Sunday[1]\}} - \text{sys_days\{1970y/January/1\}})
\end{equation}

template<class Duration, class charT>
struct formatter<chrono::file_time<Duration>, charT>;

Remarks: If %Z is used, it is replaced with \texttt{STATICALLY-WIDEN<charT>("UTC")}. If %z (or a modified variant of %z) is used, an offset of 0\,\text{min} is formatted. The date and time formatted are equivalent to those formatted by a \texttt{sys_time} initialized with \texttt{clock_cast<system_clock>>(t)} or by a \texttt{utc_time} initialized with \texttt{clock_cast<utc_clock>>(t)} where \(t\) is the first argument to \texttt{format}.

template<class Duration, class charT>
struct formatter<chrono::local_time<Duration>, charT>;

Remarks: If %Z, %z, or a modified version of %z is used, an exception of type \texttt{format_error} is thrown.

\begin{verbatim}
template<class Duration> struct local-time-format-t {
    // exposition only
    local_time<Duration> time;
    // exposition only
    const string* abbrev;
    // exposition only
    const seconds* offset_sec;
};
\end{verbatim}

\begin{verbatim}
local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
                 const seconds* offset_sec = nullptr);
\end{verbatim}

Returns: \{\texttt{time}, \texttt{abbrev}, \texttt{offset_sec}\}.

\begin{verbatim}
template<class Duration, class TimeZonePtr, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT> : formatter<chrono::local-time-format-t<Duration>, charT>
{
    template<class FormatContext>
    typename FormatContext::iterator
\end{verbatim}
format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;  

};

template<class FormatContext>
    typename FormatContext::iterator
    format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;

    Effects: Equivalent to:
    
    sys_info info = tp.get_info();
    return formatter<chrono::local-time-format-t<Duration>, charT>::
        format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);

29.13 Parsing

Each parse overload specified in this subclause calls from_stream unqualified, so as to enable argument dependent lookup (6.5.4). In the following paragraphs, let is denote an object of type basic_istream<charT, traits> and let I be basic_istream<charT, traits>&, where charT and traits are template parameters in that context.

Recommended practice: Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by parse immovable and preventing stream extraction into an lvalue of such a manipulator type.

template<class charT, class Parsable>
    unspecified
    parse(const charT* fmt, Parsable& tp);

    template<class charT, class traits, class Alloc, class Parsable>
    unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);

Let F be fmt for the first overload and fmt.c_str() for the second overload. Let traits be char_traits<charT> for the first overload.

Constraints: The expression
    from_stream(declval<basic_istream<charT, traits>&&>()(), F, tp)
is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression is >> parse(fmt, tp) has type I, has value is, and calls from_stream(is, F, tp).

    template<class charT, class traits, class Alloc, class Parsable>
    unspecified
    parse(const charT* fmt, Parsable& tp, minutes& offset);

    template<class charT, class traits, class Alloc, class Parsable>
    unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp, minutes& offset);

Let F be fmt for the first overload and fmt.c_str() for the second overload.

Constraints: The expression
    from_stream(declval<basic_istream<charT, traits>&&>()(), F, tp, addressof(abbrev))
is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression is >> parse(fmt, tp, abbrev) has type I, has value is, and calls from_stream(is, F, tp, addressof(abbrev)).
Let $F$ be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` and `Alloc` be `allocator<charT>` for the first overload.

**Constraints**: The expression
```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp,
            declval<basic_string<charT, traits, Alloc>&>(),
            &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

**Returns**: A manipulator such that the expression `is >> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:
```
from_stream(is,
            F, tp,
            static_cast<basic_string<charT, traits, Alloc>&>(nullptr),
            &offset)
```

```cpp
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

```cpp
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

Let $F$ be `fmt` for the first overload and `fmt.c_str()` for the second overload.

**Constraints**: The expression
```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp,
            addressof(abbrev), &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

**Returns**: A manipulator such that the expression `is >> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev), &offset)`.

All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by E or O. During parsing each flag interprets characters as parts of date and time types according to Table 102. Some flags can be modified by a width parameter given as a positive decimal integer called out as $N$ below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 102, except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

**Example 1**: A duration cannot represent a weekday. — end example

However, if a flag refers to a “time of day” (e.g., `%H, %I, %p`, etc.), then a specialization of duration is parsed as the time of day elapsed since midnight.

If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Parsed value</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>The locale’s full or abbreviated case-insensitive weekday name.</td>
</tr>
<tr>
<td>%A</td>
<td>Equivalent to %a.</td>
</tr>
<tr>
<td>%b</td>
<td>The locale’s full or abbreviated case-insensitive month name.</td>
</tr>
</tbody>
</table>

<tr>
<td>%B</td>
<td>Equivalent to %b.</td>
</tr>
<tr>
<td>%c</td>
<td>The locale’s date and time representation. The modified command %Ec interprets the locale’s alternate date and time representation.</td>
</tr>
<tr>
<td>%C</td>
<td>The century as a decimal number. The modified command %NC specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %EC interprets the locale’s alternative representation of the century.</td>
</tr>
<tr>
<td>%d</td>
<td>The day of the month as a decimal number. The modified command %Nd specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Od interprets the locale’s alternative representation of the day of the month.</td>
</tr>
<tr>
<td>%D</td>
<td>Equivalent to %m/%d/%y.</td>
</tr>
<tr>
<td>%e</td>
<td>Equivalent to %d and can be modified like %d.</td>
</tr>
<tr>
<td>%F</td>
<td>Equivalent to %Y-%m-%d. If modified with a width N, the width is applied to only %Y.</td>
</tr>
<tr>
<td>%g</td>
<td>The last two decimal digits of the ISO week-based year. The modified command %Ng specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%G</td>
<td>The ISO week-based year as a decimal number. The modified command %NG specifies the maximum number of characters to read. If N is not specified, the default is 4. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%h</td>
<td>Equivalent to %b.</td>
</tr>
<tr>
<td>%H</td>
<td>The hour (24-hour clock) as a decimal number. The modified command %NH specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OH interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%I</td>
<td>The hour (12-hour clock) as a decimal number. The modified command %NI specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OI interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%j</td>
<td>If the type being parsed is a specialization of duration, a decimal number of days. Otherwise, the day of the year as a decimal number. Jan 1 is 1. In either case, the modified command %Nj specifies the maximum number of characters to read. If N is not specified, the default is 3. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%m</td>
<td>The month as a decimal number. Jan is 1. The modified command %Nm specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Om interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%M</td>
<td>The minutes as a decimal number. The modified command %NM specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OM interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%n</td>
<td>Matches one whitespace character.</td>
</tr>
<tr>
<td></td>
<td>[Note 1: %n, %t, and a space can be combined to match a wide range of whitespace patterns. For example, &quot;%n &quot; matches one or more whitespace characters, and &quot;%n%t%t&quot; matches one to three whitespace characters. — end note]</td>
</tr>
<tr>
<td>%p</td>
<td>The locale’s equivalent of the AM/PM designations associated with a 12-hour clock.</td>

29.14 Hash support

```
template<class Rep, class Period> struct hash<chrono::duration<Rep, Period>>;
```

1. The specialization `hash<chrono::duration<Rep, Period>>` is enabled (22.10.19) if and only if `hash<Rep>` is enabled. The member functions are not guaranteed to be noexcept.

```
template<class Clock, class Duration> struct hash<chrono::time_point<Clock, Duration>>;
```

2. The specialization `hash<chrono::time_point<Clock, Duration>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled. The member functions are not guaranteed to be noexcept.
The specializations are enabled (22.10.19).

[Note 1: All the hash<Key> specializations listed above meet the Cpp17Cpp17Hash requirements, even when called on objects k of type Key such that k.ok() is false. — end note]

The specialization is enabled (22.10.19).

The specializations are enabled (22.10.19).

The specializations are enabled (22.10.19).

§ 29.15  Header <ctime> synopsis [ctime.syn]

#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {

using size_t = see 17.2.4;
using clock_t = see below;
using time_t = see below;

struct timespec;

struct tm;

clock_t clock();
double difftime(time_t time1, time_t time0);
time_t mktime(tm* timeptr);
time_t time(time_t* timer);
int timespec_get(timespec* ts, int base);
char* asctime(const tm* timeptr);
char* ctime(const time_t* timer);
tm* gmtime(const time_t* timer);
tm* localtime(const time_t* timer);
size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}

1 The contents of the header <ctime> are the same as the C standard library header <time.h>. 239

2 The functions asctime, ctime, gmtime, and localtime are not required to avoid data races (16.4.6.10).

See also: ISO C 7.27

239) strftime supports the C conversion specifiers C, D, e, F, g, G, h, r, R, t, T, u, V, and z, and the modifiers E and D.
# 30 Localization library

## 30.1 General

This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 103.

<table>
<thead>
<tr>

}

1 The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.\textsuperscript{240}

30.3 Locales

30.3.1 Class locale

30.3.1.1 General

namespace std {
    class locale {
    public:
        // 30.3.1.2, types
        // 30.3.1.2.2, class locale::facet
        class facet;
        // 30.3.1.2.3, class locale::id
        class id;
        // 30.3.1.2.4, type locale::category
        using category = int;
        static const category // values assigned here are for exposition only
            none = 0,
            collate = 0x010, ctype = 0x020,
            monetary = 0x040, numeric = 0x080,
            time = 0x100, messages = 0x200,
            all = collate | ctype | monetary | numeric | time | messages;

\textsuperscript{240} In this subclause, the type name \texttt{tm} is an incomplete type that is defined in `<ctime>` (29.15).
// 30.3.1.3, construct/copy/destroy
locale() noexcept;
locale(const locale& other)  noexcept;
explicit locale(const char* std_name);
explicit locale(const string& std_name);
locale(const locale& other, const char* std_name, category);
locale(const locale& other, const string& std_name, category);
template<class Facet> locale(const locale& other, Facet* f);
locale(const locale& other, const locale& one, category);
~locale();  // not virtual
const locale& operator=(const locale& other)  noexcept;

// 30.3.1.4, locale operations
locale combine(const locale& other) const;
string name() const;
text_encoding encoding() const;
bool operator==(const locale& other) const;

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
const basic_string<charT, traits, Allocator>& s2) const;

// 30.3.1.6, global locale objects
static locale global(const locale&);
static const locale& classic();
};

1 Class locale implements a type-safe polymorphic set of facets, indexed by facet type. In other words, a facet has a dual role: in one sense, it’s just a class interface; at the same time, it’s an index into a locale’s set of facets.

2 Access to the facets of a locale is via two function templates, use_facet<> and has_facet<>.

[Example 1: An iostream operator<< can be implemented as:]241

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
        tm tmbuf; d.extract(tmbuf);
        bool failed =
            use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
        if (failed)
            s.setstate(s.badbit);  // can throw
    }
    return s;
}
```

—end example—

4 In the call to use_facet<Facet>(loc), the type argument chooses a facet, making available all members of the named type. If Facet is not present in a locale, it throws the standard exception bad_cast. A C++ program can check if a locale implements a particular facet with the function template has_facet<Facet>(). User-defined facets may be installed in a locale, and used identically as may standard facets.

5 [Note 1: All locale semantics are accessed via use_facet<> and has_facet<>], except that:

(5.1) A member operator template

```cpp
    operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

241) Note that in the call to put, the stream is implicitly converted to an ostreambuf_iterator<charT, traits>. 

§ 30.3.1.1  1598
© ISO/IEC

(5.2) — Convenient global interfaces are provided for traditional _ctype_ functions such as _isdigit()_ and _isspace()_, so that given a locale object _loc_ a C++ program can call _isspace(c, loc)_ (This eases upgrading existing extractors (31.7.5.3)).

— end note

6 Once a facet reference is obtained from a locale object by calling _use_facet<>_, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

7 In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

8 A _locale_ constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, _locale::name_() returns the string "*".

9 Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

30.3.1.2 Types [locale.types]

30.3.1.2.1 Type _locale::category_ [locale.category]

using category = int;

1 Valid _category_ values include the _locale_ member bitmask elements _collate_, _ctype_, _monetary_, _numeric_, _time_, and _messages_, each of which represents a single locale category. In addition, _locale_ member bitmask constant _none_ is defined as zero and represents no category. And _locale_ member bitmask constant _all_ is defined such that the expression

\[(\text{collate} \mid \text{ctype} \mid \text{monetary} \mid \text{numeric} \mid \text{time} \mid \text{messages} \mid \text{all}) == \text{all}\]

is _true_, and represents the union of all categories. Further, the expression \((X \mid Y)\), where _X_ and _Y_ each represent a single category, represents the union of the two categories.

2 _locale_ member functions expecting a _category_ argument require one of the _category_ values defined above, or the union of two or more such values. Such a _category_ value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in _Table 104_.

<table>
<thead>
<tr>
<th>Category</th>
<th>Includes facets</th>
</tr>
</thead>
<tbody>
<tr>
<td>collate</td>
<td><em>collate&lt;char, collate&lt;wchar_t&gt;</em>, collate&lt;wchar_t&gt;_</td>
</tr>
<tr>
<td>ctype</td>
<td>_ctype&lt;char&gt;, ctype&lt;wchar_t&gt;, <em>codecvt&lt;char, char, mbstate_t&gt;</em></td>
</tr>
<tr>
<td></td>
<td><em>codecvt&lt;char16_t, char8_t, mbstate_t&gt;</em></td>

<td><em>time_get&lt;char&gt;, time_get&lt;wchar_t&gt;</em>_</td>
</tr>
<tr>
<td></td>
<td><em>time_put&lt;char&gt;, time_put&lt;wchar_t&gt;</em>_</td>
</tr>
<tr>
<td>messages</td>
<td><em>messages&lt;char&gt;, messages&lt;wchar_t&gt;</em>_</td>
</tr>
</tbody>
</table>

3 For any locale _loc_ either constructed, or returned by _locale::classic_(), and any facet _Facet_ shown in _Table 104_, _has_facet<Facet>(loc)_ is _true_. Each _locale_ member function which takes a _locale::category_ argument operates on the corresponding set of facets.
An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 105.

</tbody>
</table>

The provided implementation of members of facets num_get<charT> and num_put<charT> calls use_facet<F>(l) only for facet F of types numpunct<charT> and ctype<charT>, and for locale l the value obtained by calling member getloc() on the ios_base& argument to these functions.

In declarations of facets, a template parameter with name InputIterator or OutputIterator indicates the set of all possible specializations on parameters that meet the Cpp17InputIterator requirements or Cpp17OutputIterator requirements, respectively (25.3). A template parameter with name C represents the set of types containing char, wchar_t, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name International represents the set of all possible specializations on a bool parameter.

30.3.1.2.2 Class locale::facet

namespace std {
    class locale::facet {
        protected:
            explicit facet(size_t refs = 0);
            virtual ~facet();
            facet(const facet&) = delete;
            void operator=(const facet&) = delete;
        };
    };
}

Class facet is the base class for locale feature sets. A class is a facet if it is publicly derived from another facet, or if it is a class derived from locale::facet and contains a publicly accessible declaration as follows:242

    static ::std::locale::id id;

Template parameters in this Clause which are required to be facets are those named Facet in declarations. A program that passes a type that is not a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a Facet template parameter.

242) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.
The `refs` argument to the constructor is used for lifetime management. For \( \text{refs} = 0 \), the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `\text{refs} = 1`, the implementation never destroys the facet.

Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are `explicit`, preventing their participation in implicit conversions.

For some standard facets a standard “..._byname” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no “..._byname” version of a facet, the base class implements named locale semantics itself by reference to other facets.

### 30.3.1.2.3 Class `locale::id`

```
namespace std {
    class locale::id {
        public:
            id();
            id(const id&) = delete;
            id(id&) = delete;
    }
}
```

The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

[Note 1: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet’s `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2). — end note]

### 30.3.1.3 Constructors and destructor

```
locale() noexcept;
```

**Effects:** Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

[Note 1: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`. — end note]

```
explicit locale(const char* std_name);
```

**Effects:** Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

**Throws:** `runtime_error` if the argument is not valid, or is null.

**Remarks:** The set of valid string argument values is "C", "", and any implementation-defined values.

```
explicit locale(const string& std_name);
```

**Effects:** Equivalent to `locale(std_name.c_str())`.

```
locale(const locale& other, const char* std_name, category cats);
```

**Preconditions:** `cats` is a valid `category` value (30.3.1.2.1).

**Effects:** Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

**Throws:** `runtime_error` if the second argument is not valid, or is null.

**Remarks:** The locale has a name if and only if `other` has a name.

```
locale(const locale& other, const string& std_name, category cats);
```

**Effects:** Equivalent to `locale(other, std_name.c_str(), cats)`.
template<class Facet> locale(const locale& other, Facet* f);

Effects: Constructs a locale incorporating all facets from the first argument except that of type Facet, and installs the second argument as the remaining facet. If f is null, the resulting object is a copy of other.

Remarks: If f is null, the resulting locale has the same name as other. Otherwise, the resulting locale has no name.

locale(const locale& other, const locale& one, category cats);

Preconditions: cats is a valid category value.

Effects: Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.

Remarks: If cats is equal to locale::none, the resulting locale has a name if and only if the first argument has a name. Otherwise, the resulting locale has a name if and only if the first two arguments both have names.

const locale& operator=(const locale& other) noexcept;

Effects: Creates a copy of other, replacing the current value.

Returns: *this.

30.3.1.4 Members

template<class Facet> locale combine(const locale& other) const;

Effects: Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.

Returns: The newly created locale.

Throws: runtime_error if has_facet<Facet>(other) is false.

Remarks: The resulting locale has no name.

string name() const;

Returns: The name of *this, if it has one; otherwise, the string "*".

text_encoding encoding() const;

Mandates: CHAR_BIT == 8 is true.

Returns: A text_encoding object representing the implementation-defined encoding scheme associated with the locale *this.

30.3.1.5 Operators

bool operator==(const locale& other) const;

Returns: true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1, const basic_string<charT, traits, Allocator>& s2) const;

Effects: Compares two strings according to the collate<charT> facet.

Returns:

use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(), s2.data(), s2.data() + s2.size()) < 0

Remarks: This member operator template (and therefore locale itself) meets the requirements for a comparator predicate template argument (Clause 27) applied to strings.

[Example 1: A vector of strings v can be collated according to collation rules in locale loc simply by (27.8.2, 24.3.11):

std::sort(v.begin(), v.end(), loc);
—end example]
30.3.1.6 Static members

```cpp
static locale global(const locale& loc);
```

1. **Effects:** Sets the global locale to its argument. Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does `setlocale(LC_ALL, loc.name().c_str());`
   otherwise, the effect on the C locale, if any, is implementation-defined.

2. **Returns:** The previous value of `locale()`.

3. **Remarks:** No library function other than `locale::global()` affects the value returned by `locale()`.

   [Note 1: See 30.5 for data race considerations when `setlocale` is invoked. — end note]

```cpp
static const locale& classic();
```

4. **The "C" locale.**

5. **Returns:** A locale that implements the classic "C" locale semantics, equivalent to the value `locale("C")`.

6. **Remarks:** This locale, its facets, and their member functions, do not change with time.

30.3.2 locale globals

```cpp
template<class Facet> const Facet& use_facet(const locale& loc);
```

1. **Mandates:** `Facet` is a facet class whose definition contains the public static member `id` as defined in 30.3.1.2.2.

2. **Returns:** A reference to the corresponding facet of `loc`, if present.

3. **Throws:** `bad_cast` if `has_facet<Facet>(loc)` is `false`.

4. **Remarks:** The reference returned remains valid at least as long as any copy of `loc` exists.

```cpp
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

5. **Returns:** `true` if the facet requested is present in `loc`; otherwise `false`.

30.3.3 Convenience interfaces

30.3.3.1 Character classification

```cpp
template<class charT> bool isspace (charT c, const locale& loc);
```

```cpp
template<class charT> bool isprint (charT c, const locale& loc);
```

```cpp
template<class charT> bool iscntrl (charT c, const locale& loc);
```

```cpp
template<class charT> bool isupper (charT c, const locale& loc);
```

```cpp
template<class charT> bool islower (charT c, const locale& loc);
```

```cpp
template<class charT> bool isalpha (charT c, const locale& loc);
```

```cpp
template<class charT> bool isdigit (charT c, const locale& loc);
```

```cpp
template<class charT> bool ispunct (charT c, const locale& loc);
```

```cpp
template<class charT> bool isxdigit(charT c, const locale& loc);
```

```cpp
template<class charT> bool isalnum (charT c, const locale& loc);
```

```cpp
template<class charT> bool isgraph (charT c, const locale& loc);
```

```cpp
template<class charT> bool isblank (charT c, const locale& loc);
```

1. Each of these functions `isF` returns the result of the expression:

   ```cpp
   use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
   ```

   where `F` is the `ctype_base::mask` value corresponding to that function (30.4.2).

30.3.3.2 Character conversions

```cpp
template<class charT> charT toupper(charT c, const locale& loc);
```

```cpp
template<class charT> charT tolower(charT c, const locale& loc);
```

1. **Returns:** `use_facet<ctype<charT>>(loc).toupper(c)`

2. **Returns:** `use_facet<ctype<charT>>(loc).tolower(c)`.

243) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>::is`. 

§ 30.3.3.2 1603
30.4 Standard locale categories

30.4.1 General

Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users’ istream operators << and>>, as members put() and get(), respectively. Each such member function takes an ios_base& argument whose members flags(), precision(), and width(), specify the format of the corresponding datum (31.5.2). Those functions which need to use other facets call its member getloc() to retrieve the locale imbued there. Formatting facets use the character argument fill to fill out the specified width where necessary.

The put() members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The get() members take an ios_base::iostate& argument whose value they ignore, but set to ios_base::failbit in case of a parse error.

Within subclause 30.4 it is unspecified whether one virtual function calls another virtual function.

30.4.2 The ctype category

30.4.2.1 General

namespace std {
    class ctype_base {
public:
    using mask = see below;

    // numeric values are for exposition only.
    static const mask space = 1 << 0;
    static const mask print = 1 << 1;
    static const mask cntrl = 1 << 2;
    static const mask upper = 1 << 3;
    static const mask lower = 1 << 4;
    static const mask alpha = 1 << 5;
    static const mask digit = 1 << 6;
    static const mask punct = 1 << 7;
    static const mask xdigit = 1 << 8;
    static const mask blank = 1 << 9;
    static const mask alnum = alpha | digit;
    static const mask graph = alnum | punct;
    }
}

The type mask is a bitmask type (16.3.3.3.3).

30.4.2.2 Class template ctype

30.4.2.2.1 General

namespace std {
    template<class charT>
    class ctype : public locale::facet, public ctype_base {
public:
    using char_type = charT;

    explicit ctype(size_t refs = 0);

    bool is(mask m, charT c) const;
    const charT* is(const charT* low, const charT* high, mask* vec) const;
    const charT* scan_is(mask m, const charT* low, const charT* high) const;
    const charT* scan_not(mask m, const charT* low, const charT* high) const;
    charT toupper(charT c) const;
    const charT* toupper(charT* low, const charT* high) const;
    charT tolower(charT c) const;
    const charT* tolower(charT* low, const charT* high) const;
    charT widen(char c) const;
    const char* widen(const char* low, const char* high, charT* to) const;
    char narrow(charT c, char dfault) const;
    const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

    § 30.4.2.2.1 1604
static locale::id id;

protected:
- ctype();
  virtual bool do_is(mask m, charT c) const;
  virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
  virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
  virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
  virtual charT do_toupper(charT) const;
  virtual const charT* do_toupper(charT* low, const charT* high) const;
  virtual charT do_tolower(charT) const;
  virtual const charT* do_tolower(charT* low, const charT* high) const;
  virtual charT do_widen(char) const;
  virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
  virtual char do_narrow(charT, char dfault) const;
  virtual const charT* do_narrow(const charT* low, const charT* high, charT* dest) const;

};

1 Class ctype encapsulates the C library <cctype> features. istream members are required to use ctype<> for character classing during input parsing.

2 The specializations required in Table 104 (30.3.1.2.1), namely ctype<char> and ctype<wchar_t>, implement character classing appropriate to the implementation’s native character set.

30.4.2.2.2 ctype members

bool       is(mask m, charT c) const;
const charT* scan_is(mask m, const charT* low, const charT* high) const;

1 Returns: do_is(m, c) or do_is(low, high, vec).

const charT* scan_not(mask m, const charT* low, const charT* high) const;

2 Returns: do_scan_not(m, low, high).

charT      topper(charT) const;
const charT* topper(charT* low, const charT* high) const;

4 Returns: do_topper(c) or do_topper(low, high).

charT      tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;

5 Returns: do_tolower(c) or do_tolower(low, high).

charT      widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;

6 Returns: do_widen(c) or do_widen(low, high, to).

char       narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

7 Returns: do_narrow(c, dfault) or do_narrow(low, high, dfault, to).

30.4.2.2.3 ctype virtual functions

bool      do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;

1 Effects: Classifies a character or sequence of characters. For each argument character, identifies a value M of type ctype_base::mask. The second form identifies a value M of type ctype_base::mask for each *p where (low <= p && p < high), and places it into vec[p - low].
Returns: The first form returns the result of the expression \((M \& m) \neq 0\); i.e., true if the character has the characteristics specified. The second form returns high.

```c
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
```

Effects: Locates a character in a buffer that conforms to a classification \(m\).

Returns: The smallest pointer \(p\) in the range \([low, high)\) such that \(\text{is}(m, *p)\) would return true; otherwise, returns high.

```c
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
```

Effects: Locates a character in a buffer that fails to conform to a classification \(m\).

Returns: The smallest pointer \(p\), if any, in the range \([low, high)\) such that \(\text{is}(m, *p)\) would return false; otherwise, returns high.

```c
charT do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;
```

Effects: Converts a character or characters to upper case. The second form replaces each character \(*p\) in the range \([low, high)\) for which a corresponding upper-case character exists, with that character.

Returns: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns high.

```c
charT do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;
```

Effects: Converts a character or characters to lower case. The second form replaces each character \(*p\) in the range \([low, high)\) and for which a corresponding lower-case character exists, with that character.

Returns: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns high.

```c
charT do_widen(char c) const;
const char* do_widen(const char* low, const char* high, charT* dest) const;
```

Effects: Applies the simplest reasonable transformation from a char value or sequence of char values to the corresponding charT value or values.\(^{244}\) The only characters for which unique transformations are required are those in the basic character set (5.3).

For any named ctype category with a ctype<charT> facet \(ctc\) and valid ctype_base::mask value \(M\), \((\text{ctc.is}(M, c) || !\text{is}(M, \text{do_widen}(c)))\) is true.\(^{245}\)

The second form transforms each character \(*p\) in the range \([low, high)\), placing the result in \(dest[p - low]\).

Returns: The first form returns the transformed value. The second form returns high.

```c
char do_narrow(charT c, char dfault) const;
const char* do_narrow(const charT* low, const charT* high, charT* dest) const;
```

Effects: Applies the simplest reasonable transformation from a charT value or sequence of charT values to the corresponding char value or values.

For any character \(c\) in the basic character set (5.3) the transformation is such that

\[
\text{do_widen(\text{do_narrow}(c, 0))} = c
\]

For any named ctype category with a ctype<char> facet \(ctc\) however, and ctype_base::mask value \(M\),

\[
(\text{is}(M, c) || !\text{ctc.is}(M, \text{do_narrow}(c, \text{dfault})))
\]

is true (unless \(\text{do_narrow}\) returns \(\text{dfault}\)). In addition, for any digit character \(c\), the expression \((\text{do_narrow}(c, \text{dfault}) - '0')\) evaluates to the digit value of the character. The second form transforms each character \(*p\) in the range \([low, high)\), placing the result (or \(\text{dfault}\) if no simple transformation is readily available) in \(dest[p - low]\).

---

\(^{244}\) The parameter \(c\) of \(\text{do_widen}\) is intended to accept values derived from character-literals for conversion to the locale’s encoding.

\(^{245}\) In other words, the transformed character is not a member of any character classification that \(c\) is not also a member of.
Returns: The first form returns the transformed value; or default if no mapping is readily available. The second form returns high.

30.4.2.3 Class template ctype_byname

namespace std {
    template<class charT>
    class ctype_byname : public ctype<charT> {
    public:
        using mask = typename ctype<charT>::mask;
        explicit ctype_byname(const char*, size_t refs = 0);
        explicit ctype_byname(const string&, size_t refs = 0);
        
        protected:
            ~ctype_byname();
    };
}

30.4.2.4 ctype<char> specialization

30.4.2.4.1 General

namespace std {
    template<class charT>
    class ctype_byname : public locale::facet, public ctype_base {
    public:
        using char_type = char;
        explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);
        bool is(mask m, char c) const;
        const char* is(const char* low, const char* high, mask* vec) const;
        const char* scan_is (mask m, const char* low, const char* high) const;
        const char* scan_not(mask m, const char* low, const char* high) const;
        char toupper(char c) const;
        const char* toupper(char* low, const char* high) const;
        char tolower(char c) const;
        const char* tolower(char* low, const char* high) const;
        char widen(char c) const;
        const char* widen(const char* low, const char* high, char* to) const;
        char narrow(char c, char dfault) const;
        const char* narrow(const char* low, const char* high, char dfault, char* to) const;
        static locale::id id;
        static const size_t table_size = implementation-defined;
        const mask* table() const noexcept;
        static const mask* classic_table() noexcept;
        
        protected:
            ~ctype();
            virtual char do_toupper(char c) const;
            virtual const char* do_toupper(char* low, const char* high) const;
            virtual char do_tolower(char c) const;
            virtual const char* do_tolower(char* low, const char* high) const;
            virtual char do_widen(char c) const;
            virtual const char* do_widen(const char* low, const char* high, char* to) const;
            virtual char do_narrow(char c, char dfault) const;
            virtual const char* do_narrow(const char* low, const char* high, char dfault, char* to) const;
    };
}
A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.\(^{246}\) The implementation-defined value of member `table_size` is at least 256.

30.4.2.4.2 Destructor

`~ctype();`

**Effects:** If the constructor’s first argument was nonzero, and its second argument was `true`, does `delete [] table();`.

30.4.2.4.3 Members

In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table()[v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```plaintext
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

**Preconditions:** Either `tbl == nullptr` is `true` or `[tbl, tbl+table_size)` is a valid range.

**Effects:** Passes its `refs` argument to its base class constructor.

```plaintext
bool is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

**Effects:** The second form, for all `*p` in the range `[low, high)`, assigns into `vec[p - low]` the value `table()[((unsigned char)*p)`.

**Returns:** The first form returns `table()[((unsigned char)c) & m`; the second form returns `high`.

```plaintext
const char* scan_is(mask m, const char* low, const char* high) const;
```

**Returns:** The smallest `p` in the range `[low, high)` such that `table()[((unsigned char) *p) & m` is `true`.

```plaintext
const char* scan_not(mask m, const char* low, const char* high) const;
```

**Returns:** The smallest `p` in the range `[low, high)` such that `table()[((unsigned char) *p) & m` is `false`.

```plaintext
toupper(char c) const;
toupper(char* low, const char* high) const;
```

**Returns:** `do_toupper(c)` or `do_toupper(low, high)`, respectively.

```plaintext
tolower(char c) const;
tolower(char* low, const char* high) const;
```

**Returns:** `do_tolower(c)` or `do_tolower(low, high)`, respectively.

```plaintext
widen(char c) const;
widen(const char* low, const char* high, char* to) const;
```

**Returns:** `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```plaintext
narrow(char c, char dfault) const;
narrow(const char* low, const char* high, char* to) const;
```

**Returns:** `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

```plaintext
const mask* table() const noexcept;
```

**Returns:** The first constructor argument, if it was nonzero, otherwise `classic_table()`.

\(^{246}\) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.
30.4.2.4.4 Static members

static const mask* classic_table() noexcept;

Returns: A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the "C" locale.

30.4.2.4.5 Virtual functions

These functions are described identically as those members of the same name in the `ctype` class template (30.4.2.2.2).

30.4.2.5 Class template codecvt

30.4.2.5.1 General

namespace std {
    class codecvt_base {
    public:
        enum result { ok, partial, error, noconv }; 
    };

    template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
    public:
        using intern_type = internT;
        using extern_type = externT;
        using state_type = stateT;

        explicit codecvt(size_t refs = 0);

        result out(
            stateT& state,
            const internT* from, const internT* from_end, const internT*& from_next,
            externT* to,       externT* to_end,       externT*& to_next) const;

        result unshift(
            stateT& state,
            externT* to,       externT* to_end,       externT*& to_next) const;

        result in(
            stateT& state,
            const externT* from, const externT* from_end, const externT*& from_next,
            internT* to,       internT* to_end,       internT*& to_next) const;

        int encoding() const noexcept;
        bool always_noconv() const noexcept;
        int length(stateT&, const externT* from, const externT* end, size_t max) const;
        int max_length() const noexcept;

        static locale::id id;
    };

protected:
    ~codecvt();
The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

The `stateT` argument selects the pair of character encodings being mapped between.

The specializations required in Table 104 (30.3.1.2.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

30.4.2.5.3 Virtual functions

result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;

1 Preconditions: \((from \leq from\_end \&\& to \leq to\_end)\) is well-defined and true; state is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

2 Effects: Translates characters in the source range \([from, from\_end)\), placing the results in sequential positions starting at destination to. Converts no more than \((from\_end - from)\) source elements, and stores no more than \((to\_end - to)\) destination elements.

3 Stops if it encounters a character it cannot convert. It always leaves the from_next and to_next pointers pointing one beyond the last element successfully converted. If returns noconv, internT and externT are the same type and the converted sequence is identical to the input sequence \([from, from\_next)\). to_next is set equal to to, the value of state is unchanged, and there are no changes to the values in [to, to_end).

A codecvt facet that is used by basic_filebuf (31.10) shall have the property that if

\[
\text{do_out}(\text{state}, \text{from}, \text{from}\_end, \text{from}\_next, \text{to}, \text{to}\_end, \text{to}\_next)
\]

would return ok, where from != from_end, then

\[
\text{do_out}(\text{state}, \text{from}, \text{from} + 1, \text{from}\_next, \text{to}, \text{to}\_end, \text{to}\_next)
\]

shall also return ok, and that if

\[
\text{do_in}(\text{state}, \text{from}, \text{from}\_end, \text{from}\_next, \text{to}, \text{to}\_end, \text{to}\_next)
\]

would return ok, where to != to_end, then

\[
\text{do_in}(\text{state}, \text{from}, \text{from}\_end, \text{from}\_next, \text{to}, \text{to} + 1, \text{to}\_next)
\]

shall also return ok. 247

[Note 1: As a result of operations on state, it can return ok or partial and set from_next == from and to_next != to. — end note]

5 Returns: An enumeration value, as summarized in Table 106.

Table 106: do_in/do_out result values

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the conversion</td>
</tr>
<tr>
<td>partial</td>
<td>not all source characters converted</td>
</tr>
<tr>
<td>error</td>
<td>encountered a character in [from, from_end) that cannot be converted</td>
</tr>
<tr>
<td>noconv</td>
<td>internT and externT are the same type, and input sequence is identical to converted sequence</td>
</tr>
</tbody>
</table>

A return value of partial, if \((from\_next == from\_end)\), indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

6 Remarks: Its operations on state are unspecified.

[Note 2: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. — end note]

247) Informally, this means that basic_filebuf assumes that the mappings from internal to external characters is 1 to N: that a codecvt facet that is used by basic_filebuf can translate characters one internal character at a time.
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

7 Preconditions: (to <= to_end) is well-defined and true; state is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

8 Effects: Places characters starting at to that should be appended to terminate a sequence when the current stateT is given by state. Stores no more than (to_end - to) destination elements, and leaves the to_next pointer pointing one beyond the last element successfully stored.

9 Returns: An enumeration value, as summarized in Table 107.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the sequence</td>
</tr>
<tr>
<td>partial</td>
<td>space for more than to_end - to destination elements was needed to terminate a sequence given the value of state</td>
</tr>
<tr>
<td>error</td>
<td>an unspecified error has occurred</td>
</tr>
<tr>
<td>noconv</td>
<td>no termination is needed for this state_type</td>
</tr>
</tbody>
</table>

10 int do_encoding() const noexcept;

10 Returns: -1 if the encoding of the externT sequence is state-dependent; else the constant number of externT characters needed to produce an internal character; or 0 if this number is not a constant.

11 bool do_always_noconv() const noexcept;

11 Returns: true if do_in() and do_out() return noconv for all valid argument values. codecvt<char, char, mbstate_t> returns true.

12 int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

12 Preconditions: (from <= from_end) is well-defined and true; state is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

13 Effects: The effect on the state argument is as if it called do_in(state, from, from_end, from, to, to+max, to) for to pointing to a buffer of at least max elements.

14 Returns: (from_next-from) where from_next is the largest value in the range [from, from_end] such that the sequence of values in the range [from, from_next) represents max or fewer valid complete characters of type internT. The specialization codecvt<char, char, mbstate_t>, returns the lesser of max and (from_end-from).

15 int do_max_length() const noexcept;

15 Returns: The maximum value that do_length(state, from, from_end, 1) can return for any valid range [from, from_end] and stateT value state. The specialization codecvt<char, char, mbstate_t>::do_max_length() returns 1.

30.4.2.6 Class template codecvt_byname

namespace std {

    template<class internT, class externT, class stateT>
    class codecvt_byname : public codecvt<internT, externT, stateT> {
    public:
        explicit codecvt_byname(const char*, size_t refs = 0);
        explicit codecvt_byname(const string&, size_t refs = 0);

        protected:
            ~codecvt_byname();
    }

}

248) Typically these will be characters to return the state to stateT().

249) If encoding() yields -1, then more than max_length() externT elements can be consumed when producing a single internT character, and additional externT elements can appear at the end of a sequence after those that yield the final internT character.
30.4.3 The numeric category

30.4.3.1 General

The classes `num_get<>` and `num_put<>` handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.\(^{250}\)

All specifications of member functions for `num_put` and `num_get` in the subclauses of 30.4.3 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base<>` argument for formatting specifications (30.4), and to its imbued locale for the `numpunct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.

Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (31.7.5.3.1, 31.7.6.3.1).

30.4.3.2 Class template `num_get` [locale.num.get]

30.4.3.2.1 General [locale.num.get.general]

```cpp
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;
            explicit num_get(size_t refs = 0);

            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, bool& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, unsigned short& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, unsigned int& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, unsigned long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, unsigned long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, float& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, long double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                ios_base::iostate& err, void*& v) const;

            static locale::id id;

        protected:
            ~num_get();
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                ios_base::iostate& err, bool& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                ios_base::iostate& err, long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                ios_base::iostate& err, long long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                ios_base::iostate& err, float& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                ios_base::iostate& err, double& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                ios_base::iostate& err, long double& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                ios_base::iostate& err, void*& v) const;
    }
}
```

\(^{250}\) Parsing "-1" correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, unsigned short& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, unsigned int& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, unsigned long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, unsigned long long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, float& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, long double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&,
    ios_base::iostate& err, void*& v) const;
};

The facet num_get is used to parse numeric values from an input sequence such as an istream.

30.4.3.2.2 Members

iter_type get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, long& val) const;

    ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, void*& val) const;

Returns: do_get(in, end, str, err, val).

30.4.3.2.3 Virtual functions

iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, double& val) const;

§ 30.4.3.2.3
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
    ios_base::iostate& err, void*& val) const;

Effects: Reads characters from in, interpreting them according to str.flags(), use_facet<ctype<charT>>(loc), and use_facet<numpunct<charT>>(loc), where loc is str.getloc().

The details of this operation occur in three stages

(2.1) — Stage 1: Determine a conversion specifier
(2.2) — Stage 2: Extract characters from in and determine a corresponding char value for the format expected by the conversion specification determined in stage 1.
(2.3) — Stage 3: Store results

The details of the stages are presented below.

Stage 1: The function initializes local variables via

fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 108. The table is ordered. That is, the first line whose condition is true applies.

Table 108: Integer conversions

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == oct</td>
<td>%o</td>
</tr>
<tr>
<td>basefield == hex</td>
<td>%X</td>
</tr>
<tr>
<td>basefield == 0</td>
<td>%i</td>
</tr>
<tr>
<td>signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversions to a floating-point type the specifier is %g.
For conversions to void* the specifier is %p.

A length modifier is added to the conversion specification, if needed, as indicated in Table 109.

Table 109: Length modifier

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>short</td>
<td>h</td>
</tr>
<tr>
<td>unsigned short</td>
<td>h</td>
</tr>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>double</td>
<td>l</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
</tbody>
</table>

Stage 2: If in == end then stage 2 terminates. Otherwise a charT is taken from in and local variables are initialized as if by

char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
  c = '.';
bool discard =
  ct == use_facet<numpunct<charT>>(loc).thousands_sep()
  && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
where the values src and atoms are defined as if by:

```cpp
static const char src[] = "0123456789abcdefpXABCDEFPX+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of loc.

If discard is true, then if '. ' has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if '. ' has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if c is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then in is advanced by ++in and processing returns to the beginning of stage 2.

[Example 1: Given an input sequence of "0x1a.bp+07p",

(3.1) if the conversion specifier returned by Stage 1 is %d, "0" is accumulated;
(3.2) if the conversion specifier returned by Stage 1 is %l, "0x1a" are accumulated;
(3.3) if the conversion specifier returned by Stage 1 is %g, "0x1a.bp+07" are accumulated.

In all cases, the remainder is left in the input. — end example]

Stage 3: The sequence of chars accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header <cstdlib>:

(3.4) For a signed integer value, the function `strtoll`.
(3.5) For an unsigned integer value, the function `strtoull`.
(3.6) For a float value, the function `strtof`.
(3.7) For a double value, the function `strtod`.
(3.8) For a long double value, the function `strtold`.

The numeric value to be stored can be one of:

(3.9) zero, if the conversion function does not convert the entire field.
(3.10) the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in val.
(3.11) the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in val.
(3.12) the converted value, otherwise.

The resultant numeric value is stored in val. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to err.

4 Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with `use_facet<numpunct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to err.

5 In any case, if stage 2 processing was terminated by the test for in == end then err |= ios_base::eofbit is performed.

```cpp
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, bool& val) const;
```

Effects: If (str.flags()&ios_base::boolalpha) == 0 then input proceeds as it would for a long except that if a value is being stored into val, the value is determined according to the following: If the value to be stored is 0 then false is stored. If the value is 1 then true is stored. Otherwise true is stored and `ios_base::failbit` is assigned to err.

7 Otherwise target sequences are determined "as if" by calling the members `false_name()` and `true_name()` of the facet obtained by `use_facet<numpunct<charT>>(str.getloc())`. Successive characters in the range [in,end) (see 24.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator in is compared to end only when necessary to obtain a character. If a target sequence is uniquely matched, val is set to the corresponding value. Otherwise false is stored and `ios_base::failbit` is assigned to err.

8 The in iterator is always left pointing one position beyond the last character successfully matched. If val is set, then err is set to str.goodbit; or to str.eofbit if, when seeking another character
to match, it is found that \((in == end)\). If \(val\) is not set, then \(err\) is set to \(str.failbit\); or to \((str.failbit|str.eofbit)\) if the reason for the failure was that \((in == end)\).

[Example 2: For targets true: "a" and false: "abb", the input sequence "a" yields \(val == true\) and \(err == str.eofbit\); the input sequence "abc" yields \(err == str.failbit\), with in ending at the 'c' element. For targets true: "1" and false: "0", the input sequence "1" yields \(val == true\) and \(err == str.goodbit\). For empty targets (""), any input sequence yields \(err == str.failbit\). —end example]

Returns: \(in\).

### 30.4.3.3 Class template num_put

#### 30.4.3.3.1 General

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
    public:
        using char_type = charT;
        using iter_type = OutputIterator;

        explicit num_put(size_t refs = 0);

        iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
        iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

        static locale::id id;

    protected:
        ~num_put();
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long v) const;
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long v) const;
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
        virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
    }
}

The facet num_put is used to format numeric values to a character sequence such as an ostream.

\end{align*}
\]

§ 30.4.3.3
Effects: Writes characters to the sequence out, formatting val as desired. In the following description, loc names a local variable initialized as
loc = str.getloc();

The details of this operation occur in several stages:

1. Stage 1: Determine a printf conversion specifier spec and determine the characters that would be printed by printf (31.13) given this conversion specifier for
   printf(spec, val)
   assuming that the current locale is the "C" locale.

2. Stage 2: Adjust the representation by converting each char determined by stage 1 to a charT using a conversion and values returned by members of use_facet<numpunct<charT>>(loc).

3. Stage 3: Determine where padding is required.

4. Stage 4: Insert the sequence into the out.

Detailed descriptions of each stage follow.

Returns: out.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables:

fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 110.

Table 110: Integer conversions  [tab:facet.num.put.int]

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == ios_base::oct</td>
<td>%o</td>
</tr>
<tr>
<td>(basefield == ios_base::hex) &amp;&amp; !uppercase</td>
<td>%x</td>
</tr>
<tr>
<td>(basefield == ios_base::hex)</td>
<td>%X</td>
</tr>
<tr>
<td>for a signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>for an unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 111.

Table 111: Floating-point conversions  [tab:facet.num.put.fp]

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>floatfield == ios_base::fixed</td>
<td>%f</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific &amp;&amp; !uppercase</td>
<td>%e</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific</td>
<td>%E</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific) &amp;&amp; !uppercase</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific)</td>
</tr>
<tr>
<td>!uppercase</td>
<td>%g</td>
</tr>
<tr>
<td>otherwise</td>
<td>%G</td>
</tr>
</tbody>
</table>
For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 112.

Table 112: Length modifier  [tab:facet.num.put.length]

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
<tr>
<td>otherwise</td>
<td>none</td>
</tr>
</tbody>
</table>

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 113.

Table 113: Numeric conversions  [tab:facet.num.put.conv]

<table>
<thead>
<tr>
<th>Type(s) State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>an integral type showpos</td>
<td>+</td>
</tr>
<tr>
<td></td>
<td>showbase</td>
</tr>
<tr>
<td>a floating-point type</td>
<td>showpos</td>
</tr>
<tr>
<td></td>
<td>showpoint</td>
</tr>
</tbody>
</table>

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)` , `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the char’s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

**Stage 2:** Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>().widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>()(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 30.4.4.1.3. Decimal point characters(.) are replaced by `punct.decimal_point()`.

**Stage 3:** A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding is determined according to Table 114.

Table 114: Fill padding  [tab:facet.num.put.fill]

<table>
<thead>
<tr>
<th>State</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustfield == ios_base::left</td>
<td>pad after</td>
</tr>
<tr>
<td>adjustfield == ios_base::right</td>
<td>pad before</td>
</tr>
<tr>
<td>adjustfield == internal and a sign occurs in the representation</td>
<td>pad after the sign</td>
</tr>
<tr>
<td>adjustfield == internal and representation after stage 1 began with 0x or 0X</td>
<td>pad after x or X</td>
</tr>
<tr>
<td>otherwise</td>
<td>pad before</td>
</tr>
</tbody>
</table>

If `str.width()` is nonzero and the number of `charT`’s in the sequence after stage 2 is less than `str.width()`, then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

251) The conversion specification #o generates a leading 0 which is not a padding character.
Stage 4: The sequence of charT’s at the end of stage 3 are output via
   *out++ = c

iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;

Returns: If (str.flags() & ios_base::boolalpha) == 0 returns do_put(out, str, fill, (int)val), otherwise obtains a string s as if by
   string_type s =
   val ? use_facet<numpunct<charT>>(loc).truename()
       : use_facet<numpunct<charT>>(loc).falsename();

and then inserts each character c of s into out via *out++ = c and returns out.

30.4.4 The numeric punctuation facet

30.4.4.1 Class template numpunct

30.4.4.1.1 General

namespace std {
   template<class charT>
   class numpunct : public locale::facet {
      public:
         using char_type = charT;
         using string_type = basic_string<charT>;

         explicit numpunct(size_t refs = 0);
         char_type decimal_point() const;
         char_type thousands_sep() const;
         string grouping() const;
         string_type truename() const;
         string_type falsename() const;

         static locale::id id;
      protected:
         -numpunct();              // virtual
         virtual char_type do_decimal_point() const;
         virtual char_type do_thousands_sep() const;
         virtual string do_grouping() const;
         virtual string_type do_truename() const;        // for bool
         virtual string_type do_falsename() const;        // for bool
    };
}

1 numpunct<> specifies numeric punctuation. The specializations required in Table 104 (30.3.1.2.1), namely numpunct<wchar_t> and numpunct<char>, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to widen.

2 The syntax for number formats is as follows, where digit represents the radix set specified by the fmtflags argument value, and thousands-sep and decimal-point are the results of corresponding numpunct<charT> members. Integer values have the format:

   intval:
      signopt units
      sign:         +
                    -
      units:        digits
                     digits thousands-sep units
   digits:        digit digitsopt

and floating-point values have:

§ 30.4.4.1.1
floatval:
    signopt units fractionalopt exponentopt
    signopt decimal-point digits exponentopt

fractional:
    decimal-point digitsopt

exponent:
    e signopt digits
    e
    E

where the number of digits between thousands-sep is as specified by do_grouping(). For parsing, if the
digits portion contains no thousands-separators, no grouping constraint is applied.

30.4.4.1.2 Members

    char_type decimal_point() const;
    // Returns: do_decimal_point().

    char_type thousands_sep() const;
    // Returns: do_thousands_sep().

    string grouping() const;
    // Returns: do_grouping().

    string_type truename() const;
    string_type falsename() const;
    // Returns: do_truename() or do_falsename(), respectively.

30.4.4.1.3 Virtual functions

    char_type do_decimal_point() const;
    // Returns: A character for use as the decimal radix separator. The required specializations return "." or
    // L".".

    char_type do_thousands_sep() const;
    // Returns: A character for use as the digit group separator. The required specializations return "," or
    // L",".

    string do_grouping() const;
    // Returns: A string vec used as a vector of integer values, in which each element vec[i] represents
    // the number of digits in the group at position i, starting with position 0 as the rightmost group. If
    // vec.size() <= i, the number is the same as group (i - 1); if (i < 0 || vec[i] <= 0 || vec[i] == CHAR_MAX), the size of the digit group is unlimited.
    // The required specializations return the empty string, indicating no grouping.

    string_type do_truename() const;
    string_type do_falsename() const;
    // Returns: A string representing the name of the boolean value true or false, respectively.
    // In the base class implementation these names are "true" and "false", or L"true" and L"false".

30.4.4.2 Class template numpunct_byname

    namespace std {
    template<class charT>
    class numpunct_byname : public numpunct<charT> {
        // this class is specialized for char and wchar_t.
        public:
            using char_type = charT;

    252) Thus, the string "\003" specifies groups of 3 digits each, and "\3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "\3".
using string_type = basic_string<charT>;

explicit numpunct_byname(const char*, size_t refs = 0);
explicit numpunct_byname(const string&, size_t refs = 0);

protected:
    -numpunct_byname();
};

30.4.5 The collate category

30.4.5.1 Class template collate

30.4.5.1.1 General

namespace std {

    template<class charT>
    class collate : public locale::facet {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;
        explicit collate(size_t refs = 0);

        int compare(const charT* low1, const charT* high1,
                    const charT* low2, const charT* high2) const;
        string_type transform(const charT* low, const charT* high) const;
        long hash(const charT* low, const charT* high) const;

        static locale::id id;
    protected:
        ~collate();
        virtual int do_compare(const charT* low1, const charT* high1,
                                const charT* low2, const charT* high2) const;
        virtual string_type do_transform(const charT* low, const charT* high) const;
        virtual long do_hash (const charT* low, const charT* high) const;
    }
}

1 The class collate<charT> provides features for use in the collation (comparison) and hashing of strings. A locale member function template, operator(), uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 27) and containers operating on strings. The specializations required in Table 104 (30.3.1.2.1), namely collate<char> and collate<wchar_t>, apply lexicographical ordering (27.8.11).

2 Each function compares a string of characters *p in the range [low,high).

30.4.5.1.2 Members

int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;

Returns: do_compare(low1, high1, low2, high2).

string_type transform(const charT* low, const charT* high) const;

Returns: do_transform(low, high).

long hash(const charT* low, const charT* high) const;

Returns: do_hash(low, high).

30.4.5.1.3 Virtual functions

int do_compare(const charT* low1, const charT* high1,
Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in Table 104 (30.3.1.2.1), namely collate<char> and collate<wchar_t>, implement a lexicographical comparison (27.8.11).

string_type do_transform(const charT* low, const charT* high) const;

Returns: A basic_string<charT> value that, compared lexicographically with the result of calling transform() on another string, yields the same result as calling do_compare() on the same two strings.

long do_hash(const charT* low, const charT* high) const;

Returns: An integer value equal to the result of calling hash() on any other string for which do_compare() returns 0 (equal) when passed the two strings.

Recommended practice: The probability that the result equals that for another string which does not compare equal should be very small, approaching \((1.0/\text{numeric_limits<unsigned long>::max()})\).

30.4.5.2 Class template collate_byname

namespace std {
    template<class charT>
    class collate_byname : public collate<charT> {
        public:
            using string_type = basic_string<charT>;
            explicit collate_byname(const char*, size_t refs = 0);
            explicit collate_byname(const string&, size_t refs = 0);
        protected:
            ~collate_byname();
    };
}

30.4.6 The time category

30.4.6.1 General

Templates time_get<charT, InputIterator> and time_put<charT, OutputIterator> provide date and time formatting and parsing. All specifications of member functions for time_put and time_get in the subclauses of 30.4.6 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1). Their members use their ios_base&, ios_base::iostate&, and fill arguments as described in 30.4, and the ctype<> facet, to determine formatting details.

30.4.6.2 Class template time_get

namespace std {
    class time_base {
        enum dateorder { no_order, dmy, mdy, ymd, ydm };
    };

    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get : public locale::facet, public time_base {
        public:
            using char_type = charT;
            using iter_type = InputIterator;
            explicit time_get(size_t refs = 0);
    };
}

253) This function is useful when one string is being compared to many other strings.

§ 30.4.6.2.1 1623
© ISO/IEC 254

1 time_get is used to parse a character sequence, extracting components of a time or date into a \texttt{tm} object. Each \texttt{get} member parses a format as produced by a corresponding format specifier to \texttt{time_put<>::put}. If the sequence being parsed matches the correct format, the corresponding members of the \texttt{tm} argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.\footnote{In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.}

2 If the end iterator is reached during parsing by any of the \texttt{get()} member functions, the member sets \texttt{ios_base::eofbit} in \texttt{err}.

## 30.4.6.2.2 Members

### [locale.time.get.members]

- **dateorder date_order()** const;
  
  \textbf{Returns}: \texttt{do_date_order()}.  

  \footnote{In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.}

  \begin{verbatim}

                                     ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base& f,
                                       ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_year(iter_type s, iter_type end, ios_base& f,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                             ios_base::iostate& err, tm* t, char format, char modifier) const;
    
  
  
\end{verbatim}

§ 30.4.6.2.2
iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;

iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;

Returns: do_get_weekday(s, end, str, err, t) or do_get_monthname(s, end, str, err, t).

iter_type get_year(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;

Returns: do_get_year(s, end, str, err, t).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
    tm* t, char format, char modifier = 0) const;

Returns: do_get(s, end, f, err, t, format, modifier).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
    tm* t, const char_type* fmt, const char_type* fmtend) const;

Preconditions: [fmt, fmtend) is a valid range.

Effects: The function starts by evaluating err = ios_base::goodbit. It then enters a loop, reading zero or more characters from s at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

- The expression fmt == fmtend evaluates to true.
- The expression err == ios_base::goodbit evaluates to false.
- The expression s == end evaluates to true, in which case the function evaluates err = ios_base::eofbit | ios_base::failbit.
- The next element of fmt is equal to '%', optionally followed by a modifier character, followed by a conversion specifier character, format, together forming a conversion specification valid for the POSIX function strftime. If the number of elements in the range [fmt, fmtend) is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates err = ios_base::failbit. Otherwise, the function evaluates s = do_get(s, end, f, err, t, format, modifier), where the value of modifier is '\0' when the optional modifier is absent from the conversion specification. If err == ios_base::goodbit holds after the evaluation of the expression, the function increments fmt to point just past the end of the conversion specification and continues looping.
- The expression isspace(*fmt, f.getloc()) evaluates to true, in which case the function first increments fmt until fmt == fmtend || !isspace(*fmt, f.getloc()) evaluates to true, then advances s until s == end || !isspace(*s, f.getloc()) is true, and finally resumes looping.
- The next character read from s matches the element pointed to by fmt in a case-insensitive comparison, in which case the function evaluates ++fmt, ++s and continues looping. Otherwise, the function evaluates err = ios_base::failbit.

Returns: s.

30.4.6.2.3 Virtual functions

dateorder do_date_order() const;

Returns: An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.\textsuperscript{255} Returns no_order if the date format specified by 'x' contains other variable components (e.g., Julian day, week number, week day).

\textsuperscript{255} This function is intended as a convenience only, for common formats, and can return no_order in valid locales.

§ 30.4.6.2.3 1625
iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;  
2 Effects: Reads characters starting at s until it has extracted those tm members, and remaining format characters, used by time_put<>::put to produce the format specified by "%H:%M:%S", or until it encounters an error or end of sequence.
3 Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;  
4 Effects: Reads characters starting at s until it has extracted those tm members and remaining format characters used by time_put<>::put to produce one of the following formats, or until it encounters an error. The format depends on the value returned by date_order() as shown in Table 115.

Table 115: do_get_date effects  [tab:locale.time.get.dogetdate]

<table>
<thead>
<tr>
<th>date_order()</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_order</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>dmy</td>
<td>&quot;%d%m%y&quot;</td>
</tr>
<tr>
<td>mdy</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>ymd</td>
<td>&quot;%y%m%d&quot;</td>
</tr>
<tr>
<td>ydm</td>
<td>&quot;%y%d%m&quot;</td>
</tr>
</tbody>
</table>
5 An implementation may also accept additional implementation-defined formats.
6 Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;  
7 Effects: Reads characters starting at s until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate tm member accordingly.
8 Returns: An iterator pointing immediately beyond the last character recognized as part of a valid name.

iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;  
9 Effects: Reads characters starting at s until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the t->tm_year member accordingly.
10 Returns: An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

iter_type do_get(iter_type s, iter_type end, ios_base& f,
    ios_base::iostate& err, tm* t, char format, char modifier) const;  
11 Preconditions: t points to an object.
12 Effects: The function starts by evaluating err = ios_base::goodbit. It then reads characters starting at s until it encounters an error, or until it has extracted and assigned those tm members, and any remaining format characters, corresponding to a conversion specification appropriate for the POSIX function strftime, formed by concatenating '%', the modifier character, when non-NUL, and the format character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by t unchanged and evaluates err |= ios_base::failbit. When s == end evaluates to true after reading a character the function evaluates err |= ios_base::eofbit.
For complex conversion specifications such as `%c`, `%x`, or `%X`, or conversion specifications that involve the optional modifiers E or O, when the function is unable to unambiguously determine some or all tm members from the input sequence [s, end), it evaluates err |= ios_base::eofbit. In such cases the values of those tm members are unspecified and may be outside their valid range.

**Returns:** An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given format and modifier.

**Remarks:** It is unspecified whether multiple calls to do_get() with the address of the same tm object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

### 30.4.6.3 Class template time_get_byname

```cpp
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get_byname : public time_get<charT, InputIterator> {
        public:
            using dateorder = time_base::dateorder;
            using iter_type = InputIterator;
            explicit time_get_byname(const char*, size_t refs = 0);
            explicit time_get_byname(const string&, size_t refs = 0);

        protected:
            ~time_get_byname();
        }
    }
```

### 30.4.6.4 Class template time_put

```cpp
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            explicit time_put(size_t refs = 0);

            // the following is implemented in terms of other member functions.
            iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                          const charT* pattern, const charT* pat_end) const;
            iter_type put(iter_type s, ios_base& f, char_type fill,
                          const tm* tmb, char format, char modifier = 0) const;

            static locale::id id;

        protected:
            ~time_put();
            virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                                      char format, char modifier) const;
        }
    }
```

### 30.4.6.4.1 Members

```cpp
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              char format, char modifier = 0) const;
```

**Effects:** The first form steps through the sequence from pattern to pat_end, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to s immediately, and each format sequence, as it is identified, results in a call to do_put; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character c to a char value as if by
ct.narrow(c, 0), where ct is a reference to ctype<charT> obtained from str.getloc(). The first character of each sequence is equal to ‘%’, followed by an optional modifier character mod<sup>256</sup> and a format specifier character spec as defined for the function strftime. If no modifier character is present, mod is zero. For each valid format sequence identified, calls do_put(s, str, fill, t, spec, mod).

The second form calls do_put(s, str, fill, t, format, modifier).

[Note 1: The fill argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — end note]

Returns: An iterator pointing immediately after the last character produced.

30.4.6.4.2 Virtual functions

iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t, char format, char modifier) const;

Effects: Formats the contents of the parameter t into characters placed on the output sequence s. Formatting is controlled by the parameters format and modifier, interpreted identically as the format specifiers in the string argument to the standard library function strftime(), except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

[Note 1: Interpretation of the modifier argument is implementation-defined. — end note]

Returns: An iterator pointing immediately after the last character produced.

[Note 2: The fill argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — end note]

Recommended practice: Interpretation of the modifier should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

30.4.6.5 Class template time_put_byname

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit time_put_byname(const char*, size_t refs = 0);
            explicit time_put_byname(const string&, size_t refs = 0);

            protected:
                ~time_put_byname();
        };
    }
}

30.4.7 The monetary category

30.4.7.1 General

These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

All specifications of member functions for money_put and money_get in the subclauses of 30.4.7 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1). Their members use their ios_base&, ios_base::iostate& and fill arguments as described in 30.4, and the moneypunct<> and ctype<> facets, to determine formatting details.

30.4.7.2 Class template money_get

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
        public:
            using char_type = charT;

256) Although the C programming language defines no modifiers, most vendors do.
using iter_type = InputIterator;
using string_type = basic_string<charT>;

explicit money_get(size_t refs = 0);

iter_type get(iter_type s, iter_type end, bool intl,
   ios_base& f, ios_base::iostate& err,
   long double& units) const;

iter_type get(iter_type s, iter_type end, bool intl,
   ios_base& f, ios_base::iostate& err,
   string_type& digits) const;

static locale::id id;
protected:
-~money_get();
virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
   ios_base::iostate& err, long double& units) const;
virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
   ios_base::iostate& err, string_type& digits) const;
};

30.4.7.2.1 Members

iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
   ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
   ios_base::iostate& err, string_type& quant) const;

1 Returns: do_get(s, end, intl, f, err, quant).

30.4.7.2.2 Virtual functions

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
   ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
   ios_base::iostate& err, string_type& digits) const;

1 Effects: Reads characters from s to parse and construct a monetary value according to the format
specified by a moneypunct<charT, Intl> facet reference mp and the character mapping specified by a
ctype<charT> facet reference ct obtained from the locale returned by str.getloc(), and str.flags().
If a valid sequence is recognized, does not change err; otherwise, sets err to (err|str.failbit), or
(err|str.failbit|str.eofbit) if no more characters are available, and does not change
units or digits. Uses the pattern returned by mp.neg_format() to parse all values. The result is returned
as an integral value stored in units or as a sequence of digits possibly preceded by a minus sign (as
produced by ct.widen(c) where c is '-' or in the range from '0' through '9' (inclusive)) stored in
digits.
[Example 1: The sequence $1,056.23 in a common United States locale would yield, for units, 105623, or, for
digits, "105623". —end example]
If mp.grouping() indicates that no thousands separators are permitted, any such characters are not
read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators
are optional; if present, they are checked for correct placement only after all format components have
been read.

2 Where money_base::space or money_base::none appears as the last element in the format pattern, no
whitespace is consumed. Otherwise, where money_base::space appears in any of the initial elements of
the format pattern, at least one whitespace character is required. Where money_base::none appears in
any of the initial elements of the format pattern, whitespace is allowed but not required. If (str.flags()
& str.showbase) is false, the currency symbol is optional and is consumed only if other characters
are needed to complete the format; otherwise, the currency symbol is required.

3 If the first character (if any) in the string pos returned by mp.positive_sign() or the string neg
returned by mp.negative_sign() is recognized in the position indicated by sign in the format pattern,
it is consumed and any remaining characters in the string are required after all the other format components.

[Example 2: If showbase is off, then for a neg value of "(*)" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if neg is "-", the "L" in "-100 L" is not consumed. — end example]

If pos or neg is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of pos or neg, and the result is given the corresponding sign. If the first character of pos is equal to the first character of neg, or if both strings are empty, the result is given a positive sign.

Digits in the numeric monetary component are extracted and placed in digits, or into a character buffer buf1 for conversion to produce a value for units, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value units is produced as if by

```c
for (int i = 0; i < n; ++i)
  buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where n is the number of characters placed in buf1, buf2 is a character buffer, and the values src and atoms are defined as if by

```c
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

30.4.7.3 Class template money_put

```c
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
  class money_put : public locale::facet {
    public:
      using char_type = charT;
      using iter_type = OutputIterator;
      using string_type = basic_string<charT>;

      explicit money_put(size_t refs = 0);

      iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
      iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;

      static locale::id id;
    protected:
      "money_put()";
      virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill, long double units) const;
      virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill, const string_type& digits) const;
  };
}
```

30.4.7.3.1 Members

```c
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

Returns: do_put(s, intl, f, loc, quant).

257) The semantics here are different from ct.narrow.
30.4.7.3.2 Virtual functions

```cpp
iter_type do_put(iter_type s, bool Intl, ios_base& str,
    char_type fill, long double units) const;
iter_type do_put(iter_type s, bool Intl, ios_base& str,
    char_type fill, const string_type& digits) const;
```

**Effects:** Writes characters to `s` according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. The argument `units` is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%0Lf", units), buf2)
```

for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen('-')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

**Returns:** An iterator pointing immediately after the last character produced.

**Remarks:** The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is true, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is true, they are placed after the other characters; otherwise, they are placed before the other characters.

[Note 1: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`. —end note]

30.4.7.4 Class template `moneypunct`

### 30.4.7.4.1 General

```cpp
namespace std {
    class money_base {
        public:
            enum part { none, space, symbol, sign, value };
            struct pattern { char field[4]; };
    };

template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
        public:
            using char_type = charT;
            using string_type = basic_string<charT>;

            explicit moneypunct(size_t refs = 0);

            charT decimal_point() const;
            charT thousands_sep() const;
            string grouping() const;
            string_type curr_symbol() const;
            string_type positive_sign() const;
            string_type negative_sign() const;
            int frac_digits() const;
            pattern pos_format() const;
            pattern neg_format() const;

            static locale::id id;
            static const bool Intl = International;
```
protected:
- moneypunct();
  virtual charT do_decimal_point() const;
  virtual charT do_thousands_sep() const;
  virtual string do_grouping() const;
  virtual string_type do_curr_symbol() const;
  virtual string_type do_positive_sign() const;
  virtual string_type do_negative_sign() const;
  virtual int do_frac_digits() const;
  virtual pattern do_pos_format() const;
  virtual pattern do_neg_format() const;
};

1 The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the `i`th component of the format. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

2 Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

3 The format of the numeric monetary value is a decimal number:

```
value:
  units fractional_opt
  decimal-point digits
fractional:
  decimal-point digits_opt
```

if `frac_digits()` returns a positive value, or

```
value:
  units
```

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```
units:
  digits
  digits thousands-sep units
digits:
  adigit digits_opt
```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range `'0'` through `'9'` (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

4 The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

30.4.7.4.2 Members

```
charT decimal_point() const;
charT thousands_sep() const;
string grouping() const;
string_type curr_symbol() const;
```
Each of these functions \( F \) returns the result of calling the corresponding virtual member function \( \text{do}_F() \).

### 30.4.7.4.3 Virtual functions

- \text{charT do_decimal_point()} \const;
- \text{charT do_thousands_sep()} \const;
- \text{string do_grouping()} \const;
- \text{string_type do_curr_symbol()} \const;
- \text{int do_frac_digits()} \const;
- \text{pattern do_pos_format()} \const;
- \text{pattern do_neg_format()} \const;

1. Each of these functions \( F \) returns the result of calling the corresponding virtual member function \( \text{do}_F() \).

### 30.4.7.5 Class template moneypunctbyname

```cpp
namespace std {
  template<class charT, bool Intl = false>
  class moneypunctbyname : public moneypunct<charT, Intl> {
    public:
      using pattern = money_base::pattern;
      using string_type = basic_string<charT>;

      explicit moneypunctbyname(const char*, size_t refs = 0);
      explicit moneypunctbyname(const string&, size_t refs = 0);
  }
}
```

---

259 In common U.S. locales this is ",".
260 In common U.S. locales this is ",,.
261 To specify grouping by 3s, the value is "\003" not "3".
262 This is usually the empty string.
263 In common U.S. locales, this is 2.
264 Note that the international symbol returned by \text{do_curr_symbol()} usually contains a space, itself, for example, "USD ".

§ 30.4.7.5
protected:
  ~moneypunct_byname();
};

30.4.8 The message retrieval category

30.4.8.1 General

Class messages<

1 Class messages<charT> implements retrieval of strings from message catalogs.

30.4.8.2 Class template messages

namespace std {
  class messages_base {
  public:
    using catalog = unspecified signed integer type;
  
  template<class charT>
  class messages : public locale::facet, public messages_base {
  public:
    using char_type = charT;
    using string_type = basic_string<charT>;
    explicit messages(size_t refs = 0);
    catalog open(const string& fn, const locale& loc) const;
    string_type get(catalog c, int set, int msgid,
                    const string_type& dfault) const;
    void close(catalog c) const;
    static locale::id id;
  protected:
    ~messages();
    virtual catalog do_open(const string& name, const locale& loc) const;
    virtual string_type do_get(catalog, int set, int msgid,
                                const string_type& dfault) const;
    virtual void do_close(catalog) const;
  };

1 Values of type messages_base::catalog usable as arguments to members get and close can be obtained only by calling member open.

30.4.8.2.2 Members

catalog open(const string& name, const locale& loc) const;

1 Returns: do_open(name, loc).

string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;

2 Returns: do_get(cat, set, msgid, dfault).

void close(catalog cat) const;

3 Effects: Calls do_close(cat).

30.4.8.2.3 Virtual functions

catalog do_open(const string& name, const locale& loc) const;

1 Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string name according to an implementation-defined mapping. The result can be used until it is passed to close().

2 Returns a value less than 0 if no such catalog can be opened.
Remarks: The locale argument loc is used for character set code conversion when retrieving messages, if needed.

```cpp
string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
```

Preconditions: `cat` is a catalog obtained from `open()` and not yet closed.

Returns: A message identified by arguments `set`, `msgid`, and `dfault`, according to an implementation-defined mapping. If no such message can be found, returns `dfault`.

```cpp
void do_close(catalog cat) const;
```

Preconditions: `cat` is a catalog obtained from `open()` and not yet closed.

Effects: Releases unspecified resources associated with `cat`.

Remarks: The limit on such resources, if any, is implementation-defined.

### 30.4.8.3 Class template `messages_byname`

```cpp
namespace std {
    template<class charT>
    class messages_byname : public messages<charT> {
        public:
            using catalog = messages_base::catalog;
            using string_type = basic_string<charT>;

            explicit messages_byname(const char*, size_t refs = 0);
            explicit messages_byname(const string&, size_t refs = 0);

    protected:
        ~messages_byname();
    }
}
```

### 30.5 C library locales

#### 30.5.1 Header `<clocale>` synopsis

```cpp
namespace std {
    struct lconv;
    char* setlocale(int category, const char* locale);
    lconv* localeconv();
}
```

#define `NULL` see 17.2.3

#define `LC_ALL` see below

#define `LC_COLLATE` see below

#define `LC_CTYPE` see below

#define `LC_MONETARY` see below

#define `LC_NUMERIC` see below

#define `LC_TIME` see below

The contents and meaning of the header `<clocale>` are the same as the C standard library header `<locale.h>`.

#### 30.5.2 Data races

Calls to the function `setlocale` may introduce a data race (16.4.6.10) with other calls to `setlocale` or with calls to the functions listed in Table 116.

See also: ISO C 7.11

### 30.6 Text encodings identification

#### 30.6.1 Header `<text_encoding>` synopsis

```cpp
namespace std {
    struct text_encoding;
}
```

§ 30.6.1
## 30.6.2 Class `text_encoding`

### 30.6.2.1 Overview

The class `text_encoding` describes an interface for accessing the IANA Character Sets registry.

```cpp
namespace std {
    struct text_encoding {
        static constexpr size_t max_name_length = 63;

        // 30.6.2.6, enumeration `text_encoding::id`
        enum class id : int_least32_t {
            see below
        };
        using enum id;
        constexpr text_encoding() = default;
        constexpr explicit text_encoding(string_view enc) noexcept;
        constexpr text_encoding(id i) noexcept;
        constexpr id mib() const noexcept;
        constexpr const char* name() const noexcept;
        struct aliases_view;
        constexpr aliases_view aliases() const noexcept;
        friend constexpr bool operator==(const text_encoding& encoding, const text_encoding& other) noexcept;
        friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;
        static consteval text_encoding literal() noexcept;
        static text_encoding environment();
        template<id i> static bool environment_is();

        private:
            id mib_ = id::unknown;  // exposition only
            char name_[max_name_length + 1] = {0};  // exposition only
            static constexpr bool comp-name(string_view a, string_view b);  // exposition only
    };
}
```

2 Class `text_encoding` is a trivially copyable type (6.8.1).

### 30.6.2.2 General

A `registered character encoding` is a character encoding scheme in the IANA Character Sets registry.
Note 1: The IANA Character Sets registry uses the term “character sets” to refer to character encodings. — end note

The primary name of a registered character encoding is the name of that encoding specified in the IANA Character Sets registry.

2 The set of known registered character encodings contains every registered character encoding specified in the IANA Character Sets registry except for the following:

(2.1) — NATS-DANO (33)
(2.2) — NATS-DANO-ADD (34)

3 Each known registered character encoding is identified by an enumerator in `text_encoding::id`, and has a set of zero or more aliases.

4 The set of aliases of a known registered character encoding is an implementation-defined superset of the aliases specified in the IANA Character Sets registry. No two aliases or primary names of distinct registered character encodings are equivalent when compared by `text_encoding::comp-name`.

5 How a `text_encoding` object is determined to be representative of a character encoding scheme implemented in the translation or execution environment is implementation-defined.

6 An object `e` of type `text_encoding` such that `e.mib() == text_encoding::id::unknown` is `false` and `e.mib() == text_encoding::id::other` is `false` maintains the following invariants:

(6.1) — `e.name() == nullptr` is `false`, and
(6.2) — `e.mib() == text_encoding(e.name()).mib()` is `true`.

7 Recommended practice:

(7.1) — Implementations should not consider registered encodings to be interchangeable.

[Example 1: Shift-JIS and Windows-31J denote different encodings. — end example]

(7.2) — Implementations should not use the name of a registered encoding to describe another similar yet different non-registered encoding unless there is a precedent on that implementation.

[Example 2: Big5 — end example]

30.6.2.3 Members

```cpp
constexpr explicit text_encoding(string_view enc) noexcept;
```

1 **Preconditions:**

(1.1) — `enc` represents a string in the ordinary literal encoding consisting only of elements of the basic character set (5.3).
(1.2) — `enc.size() <= max_name_length` is `true`.
(1.3) — `enc.contains(‘\0’)` is `false`.

2 **Postconditions:**

(2.1) — If there exists a primary name or alias `a` of a known registered character encoding such that `comp-name(a, enc)` is `true`, `mtb_` has the value of the enumerator of `id` associated with that registered character encoding. Otherwise, `mtb_ == id::other` is `true`.

(2.2) — `enc.compare(name_) == 0` is `true`.

```cpp
constexpr text_encoding(id i) noexcept;
```

3 **Preconditions:** `i` has the value of one of the enumerators of `id`.

4 **Postconditions:**

(4.1) — `mtb_ == i` is `true`.
(4.2) — If `(mtb_ == id::unknown || mtb_ == id::other)` is `true`, `strlen(name_) == 0` is `true`. Otherwise, `ranges::contains(alises(), string_view(name_))` is `true`.

```cpp
constexpr id mib() const noexcept;
```

5 **Returns:** `mtb_`.

§ 30.6.2.3
constexpr const char* name() const noexcept;

Returns: name_ if (name_[0] != ‘\0’) is true, and nullptr otherwise.

Remarks: If name() == nullptr is false, name() is an NTBS and accessing elements of name_ outside of the range name() + [0, strlen(name()) + 1) is undefined behavior.

constexpr aliases_view aliases() const noexcept;

Let r denote an instance of aliases_view. If *this represents a known registered character encoding, then:

- r.front() is the primary name of the registered character encoding,
- r contains the aliases of the registered character encoding, and
- r does not contain duplicate values when compared with strcmp.

Otherwise, r is an empty range.

Each element in r is a non-null, non-empty NTBS encoded in the literal character encoding and comprising only characters from the basic character set.

Returns: r.

[Note 1: The order of aliases in r is unspecified. — end note]

static consteval text_encoding literal() noexcept;

Mandates: CHAR_BIT == 8 is true.

Returns: A text_encoding object representing the ordinary character literal encoding (5.3).

static text_encoding environment();

Mandates: CHAR_BIT == 8 is true.

Returns: A text_encoding object representing the implementation-defined character encoding scheme of the environment. On a POSIX implementation, this is the encoding scheme associated with the POSIX locale denoted by the empty string “”.

[Note 2: This function is not affected by calls to setlocale. — end note]

Recommended practice: Implementations should return a value that is not affected by calls to the POSIX function setenv and other functions which can modify the environment (17.13).

template<id i>
static bool environment_is();

Mandates: CHAR_BIT == 8 is true.

Returns: environment() == i.

static constexpr bool comp-name(string_view a, string_view b);

Returns: true if the two strings a and b encoded in the ordinary literal encoding are equal, ignoring, from left-to-right,

- all elements that are not digits or letters (16.3.3.4.1),
- character case, and
- any sequence of one or more 0 characters not immediately preceded by a numeric prefix, where a numeric prefix is a sequence consisting of a digit in the range [1, 9] optionally followed by one or more elements which are not digits or letters,

and false otherwise.

[Note 3: This comparison is identical to the "Charset Alias Matching" algorithm described in the Unicode Technical Standard 22. — end note]

[Example 1]:

static_assert(comp-name("UTF-8", "utf8") == true);
static_assert(comp-name("u.t.f-008", "utf8") == true);
static_assert(comp-name("utf8", "utf8") == false);
static_assert(comp-name("utf-80", "utf8") == false);

— end example]
30.6.2.4 Comparison functions

friend constexpr bool operator==(const text_encoding& a, const text_encoding& b) noexcept;

1 Returns: If a.mib_ == id::other && b.mib_ == id::other is true, then comp-name(a.name_, b.name_). Otherwise, a.mib_ == b.mib_.

friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;

2 Returns: encoding.mib_ == i.

3 Remarks: This operator induces an equivalence relation on its arguments if and only if i != id::other is true.

30.6.2.5 Class text_encoding::aliases_view

struct text_encoding::aliases_view : ranges::view_interface<text_encoding::aliases_view> {
    constexpr implementation-defined begin() const;
    constexpr implementation-defined end() const;
};

1 text_encoding::aliases_view models copyable, ranges::view, ranges::random_access_range, and ranges::borrowed_range.

2 Both ranges::range_value_t<text_encoding::aliases_view> and ranges::range_reference_t<text_encoding::aliases_view> denote const char*.

30.6.2.6 Enumeration text_encoding::id

namespace std {
    enum class text_encoding::id : int_least32_t {
        other = 1,
        unknown = 2,
        ASCII = 3,
        ISOLatin1 = 4,
        ISOLatin2 = 5,
        ISOLatin3 = 6,
        ISOLatin4 = 7,
        ISOLatinCyrillic = 8,
        ISOLatinArabic = 9,
        ISOLatinGreek = 10,

};

[Note 1: The text_encoding::id enumeration contains an enumerator for each known registered character encoding. For each encoding, the corresponding enumerator is derived from the alias beginning with “cs”, as follows
— csUnicode is mapped to text_encoding::id::UCS2,
— csIBM904 is mapped to text_encoding::id::IBM904, and
— the “cs” prefix is removed from other names.
— end note]

30.6.2.7 Hash support [text.encoding.hash]

template<> struct hash<text_encoding>;

1 The specialization is enabled (22.10.19).
# 31 Input/output library

## 31.1 General

This Clause describes components that C++ programs may use to perform input/output operations.

The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 117.

<table>

</table>

## 31.2 Iostreams requirements

### 31.2.1 Imbue limitations

No function described in Clause 31 except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in Clause 31 or as an overriding virtual function of any class declared in Clause 31 calls `imbue`, the behavior is undefined.

### 31.2.2 Types

```cpp
using streamoff = implementation-defined;
```

The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.

```cpp
using streamsize = implementation-defined;
```

The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.

### 31.2.3 Positioning type limitations

The classes of Clause 31 with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.

[Note 1: For each of the specializations of `char_traits` defined in 23.2.4, `state_type` denotes `mbstate_t`, `pos_type` denotes `fpos<mbstate_t>`, and `off_type` denotes `streamoff`. — end note]

In the classes of Clause 31, a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

265) Typically `long long`.

266) Most places where `streamsize` is used would use `size_t` in ISO C, or `ssize_t` in POSIX.
31.2.4 Thread safety

Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.9.2) unless otherwise specified (31.4).

[Note 1: Data races result in undefined behavior (6.9.2). — end note]

If one thread makes a library call \( a \) that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call \( b \) such that this does not result in a data race, then \( a \)'s write synchronizes with \( b \)'s read.

31.3 Forward declarations

31.3.1 Header `<iosfwd>` synopsis

```cpp
namespace std {
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;
    template<class T> class allocator;

    template<class charT, class traits = char_traits<charT>>
    class basic_ios;

using wospanstream = basic_ospanstream<wchar_t>;
using wspanstream = basic_spanstream<wchar_t>;
using wfilebuf = basic_filebuf<wchar_t>;
using wifstream = basic_ifstream<wchar_t>;
using wofstream = basic_ofstream<wchar_t>;
using wfstream = basic_fstream<wchar_t>;
using wsyncbuf = basic_syncbuf<wchar_t>;
using wosyncstream = basic_osyncstream<wchar_t>;

template<class state> class fpos;
using streampos = fpos<char_traits<char>::state_type>;
using wstreampos = fpos<char_traits<wchar_t>::state_type>;
Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.

### 31.3.2 Overview

The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`. The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`. The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istringstream` and `basic_ifstream`. The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`. The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`. For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (23.2). —end note

Other typedef-names define instances of class templates specialized for `char` or `wchar_t` types. Specializations of the class template `fpos` are used for specifying file position information. Example 1: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. —end example

### 31.4 Standard iostream objects

#### 31.4.1 Header `<iostream>` synopsis

```cpp
#include <ios>    // see 31.5.1
#include <streambuf>  // see 31.6.1
#include <istream>   // see 31.7.1
#include <ostream>   // see 31.7.2

namespace std {
  extern istream cin;
  extern ostream cout;
  extern ostream cerr;
  extern ostream clog;

  extern wistream wcin;
  extern wostream wcout;
  extern wostream wcerr;
  extern wostream wclog;
}
```

#### 31.4.2 Overview

In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (31.13.1). The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects.

---

267) It is the implementation's responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.
The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main(6.9.3.1)` begins execution. The objects are not destroyed during program execution.\(^{268}\)

**Recommended practice:** If it is possible for them to do so, implementations should initialize the objects earlier than required.

The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Each C++ library module (16.4.2.4) in a hosted implementation shall behave as if it contains an interface unit that defines an unexported `ios_base::Init` variable with ordered initialization (6.9.3.3).

[Note 1: As a result, the definition of that variable is appearance-ordered before any declaration following the point of importation of a C++ library module. Whether such a definition exists is unobservable by a program that does not reference any of the standard iostream objects. — end note]

Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on FILEs, as specified in the C standard library.

Concurrent access to a synchronized (31.5.2.5) standard iostream object’s formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

[Note 2: Unsynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — end note]

**See also:** ISO C 7.21.2

### 31.4.3 Narrow stream objects

`istream cin;`

1. The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

2. After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream cout;`

3. The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`ostream cerr;`

4. The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

5. After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream clog;`

6. The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.4.4 Wide stream objects

`wistream wcin;`

1. The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

2. After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wcout;`

3. The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

\(^{268}\) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

§ 31.4.4 1648
wostream wcerr;

4 The object wcerr controls output to a stream buffer associated with the object stderr, declared in <cstdio> (31.13.1).

5 After the object wcerr is initialized, wcerr.flags() & unitbuf is nonzero and wcerr.tie() returns &wcout. Its state is otherwise the same as required for basic_ios<wchar_t>::init (31.5.4.2).

wostream wclog;

6 The object wclog controls output to a stream buffer associated with the object stderr, declared in <cstdio> (31.13.1).

31.5 Iostreams base classes

31.5.1 Header <ios> synopsis

#include <iosfwd> // see 31.3.1

namespace std {

using streamoff = implementation-defined;
using streamsize = implementation-defined;
template<class stateT> class fpos;

class ios_base;
template<class charT, class traits = char_traits<charT>>
class basic_ios;

// 31.5.5, manipulators

ios_base& noboolalpha(ios_base& str);

ios_base& showbase (ios_base& str);
ios_base& noshowbase (ios_base& str);

ios_base& showpoint (ios_base& str);
ios_base& noshowpoint(ios_base& str);

ios_base& showpos (ios_base& str);
ios_base& noshowpos (ios_base& str);

ios_base& skipws (ios_base& str);
ios_base& noskipws (ios_base& str);

ios_base& uppercase (ios_base& str);
ios_base& nouppercase(ios_base& str);

// 31.5.5.2, adjustfield
ios_base& internal (ios_base& str);
ios_base& left (ios_base& str);
ios_base& right (ios_base& str);

// 31.5.5.3, basefield
ios_base& dec (ios_base& str);
ios_base& hex (ios_base& str);
ios_base& oct (ios_base& str);

// 31.5.5.4, floatfield
ios_base& fixed (ios_base& str);
ios_base& scientific (ios_base& str);
ios_base& hexfloat (ios_base& str);
ios_base& defaultfloat(ios_base& str);

}
// 31.5.6, error reporting
enum class io_errc {
    stream = 1
};

template<> struct is_error_code_enum<io_errc> : public true_type { };
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;

31.5.2 Class ios_base
31.5.2.1 General

namespace std {
class ios_base {
public:
    class failure;  // see below

    // 31.5.2.2.2, fmtflags
    using fmtflags = T1;
    static constexpr fmtflags boolalpha = unspecified;
    static constexpr fmtflags dec = unspecified;
    static constexpr fmtflags fixed = unspecified;
    static constexpr fmtflags hex = unspecified;
    static constexpr fmtflags internal = unspecified;
    static constexpr fmtflags left = unspecified;
    static constexpr fmtflags oct = unspecified;
    static constexpr fmtflags right = unspecified;
    static constexpr fmtflags scientific = unspecified;
    static constexpr fmtflags showbase = unspecified;
    static constexpr fmtflags showpoint = unspecified;
    static constexpr fmtflags showpos = unspecified;
    static constexpr fmtflags skipws = unspecified;
    static constexpr fmtflags unitbuf = unspecified;
    static constexpr fmtflags uppercase = unspecified;
    static constexpr fmtflags adjustfield = see below;
    static constexpr fmtflags basefield = see below;
    static constexpr fmtflags floatfield = see below;

    // 31.5.2.2.3, iostate
    using iostate = T2;
    static constexpr iostate badbit = unspecified;
    static constexpr iostate eofbit = unspecified;
    static constexpr iostate failbit = unspecified;
    static constexpr iostate goodbit = see below;

    // 31.5.2.2.4, openmode
    using openmode = T3;
    static constexpr openmode app = unspecified;
    static constexpr openmode ate = unspecified;
    static constexpr openmode binary = unspecified;
    static constexpr openmode in = unspecified;
    static constexpr openmode noreplace = unspecified;
    static constexpr openmode out = unspecified;
    static constexpr openmode trunc = unspecified;

    // 31.5.2.2.5, seekdir
    using seekdir = T4;
    static constexpr seekdir beg = unspecified;
    static constexpr seekdir cur = unspecified;
    static constexpr seekdir end = unspecified;

    class Init;
}
ios_base

defines several member types:

(1.1) — a type failure, defined as either a class derived from system_error or a synonym for a class derived from system_error;

(1.2) — a class Init;

(1.3) — three bitmask types, fmtflags, iostate, and openmode;

(1.4) — an enumerated type, seekdir.

It maintains several kinds of data:

(2.1) — state information that reflects the integrity of the stream buffer;

(2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;

(2.3) — additional information that is stored by the program for its private use.

[Note 1: For the sake of exposition, the maintained data is presented here as:

(3.1) — static int index, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;]
(3.2) — long* iarray, points to the first element of an arbitrary-length long array maintained for the private use of the program;

(3.3) — void** parray, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

—end note]

31.5.2.2 Types

31.5.2.2.1 Class ios_base::failure

namespace std {
    class ios_base::failure : public system_error {
        public:
            explicit failure(const string& msg, const error_code& ec = io_errc::stream);
            explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    };
}

1 An implementation is permitted to define ios_base::failure as a synonym for a class with equivalent functionality to class ios_base::failure shown in this subclause.

[Note 1: When ios_base::failure is a synonym for another type, that type is required to provide a nested type failure to emulate the injected-class-name. — end note]

The class failure defines the base class for the types of all objects thrown as exceptions, by functions in the iostreams library, to report errors detected during stream buffer operations.

2 When throwing ios_base::failure exceptions, implementations should provide values of ec that identify the specific reason for the failure.

[Note 2: Errors arising from the operating system would typically be reported as system_category() errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as error_code(io_errc::stream, iostream_category()). — end note]

explicit failure(const string& msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with msg and ec.

explicit failure(const char* msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with msg and ec.

31.5.2.2.2 Type ios_base::fmtflags

using fmtflags = T1;

1 The type fmtflags is a bitmask type (16.3.3.3.3). Setting its elements has the effects indicated in Table 118.

2 Type fmtflags also defines the constants indicated in Table 119.

31.5.2.2.3 Type ios_base::iostate

using iostate = T2;

1 The type iostate is a bitmask type (16.3.3.3.3) that contains the elements indicated in Table 120.

2 Type iostate also defines the constant:

— goodbit, the value zero.

31.5.2.2.4 Type ios_base::openmode

using openmode = T3;

1 The type openmode is a bitmask type (16.3.3.3.3). It contains the elements indicated in Table 121.

31.5.2.2.5 Type ios_base::seekdir

using seekdir = T4;

1 The type seekdir is an enumerated type (16.3.3.3.2) that contains the elements indicated in Table 122.

31.5.2.2.6 Class ios_base::Init

namespace std {
    class ios_base::Init {
    public:
        Init();
        Init(const Init&) = default;
        ~Init();
        Init& operator=(const Init&) = default;

    private:
        static int init_cnt;  // exposition only
    }
}

The class Init describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (31.13.1).

For the sake of exposition, the maintained data is presented here as:

static int init_cnt, counts the number of constructor and destructor calls for class Init, initialized to zero.

Effects: Constructs and initializes the objects cin, cout, cerr, clog, wcin, wcout, wcerr, and wclog if they have not already been constructed and initialized.

~Init();

Effects: If there are no other instances of the class still in existence, calls cout.flush(), cerr.flush(), clog.flush(), wcout.flush(), wcerr.flush(), wclog.flush().

31.5.2.3 State functions

fmtflags flags() const;

Returns: The format control information for both input and output.

fmtflags flags(fmtflags fmtfl);

Postconditions: fmtfl == flags().

Returns: The previous value of flags().

fmtflags setf(fmtflags fmtfl);

Effects: Sets fmtfl in flags().

Returns: The previous value of flags().

fmtflags setf(fmtflags fmtfl, fmtflags mask);

Effects: Clears mask in flags(), sets fmtfl & mask in flags().

Returns: The previous value of flags().

void unsetf(fmtflags mask);

Effects: Clears mask in flags().

streamsize precision() const;

Returns: The precision to generate on certain output conversions.

streamsize precision(streamsize prec);

Postconditions: prec == precision().

Returns: The previous value of precision().

streamsize width() const;

Returns: The minimum field width (number of characters) to generate on certain output conversions.
streamsize width(streamsize wide);

**Postconditions:** wide == width().

**Returns:** The previous value of width().

### 31.5.2.4 Functions

```cpp
locale imbue(const locale& loc);
```

**Effects:** Calls each registered callback pair (fn, idx) (31.5.2.7) as (*fn)(imbue_event, *this, idx) at such a time that a call to `ios_base::getloc()` from within fn returns the new locale value loc.

**Postconditions:** loc == getloc().

**Returns:** The previous value of getloc().

```cpp
locale getloc() const;
```

**Returns:** If no locale has been imbued, a copy of the global C++ locale, `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

### 31.5.2.5 Static members

```cpp
static bool sync_with_stdio(bool sync = true);
```

**Effects:** If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.

**Returns:** `true` if the previous state of the standard iostream objects (31.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.

**Remarks:** When a standard iostream object `str` is **synchronized** with a standard stdio stream `f`, the effect of inserting a character `c` by

```cpp
fputc(f, c);
```

is the same as the effect of

```cpp
str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character `c` by

```cpp
c = fgetc(f);
```

is the same as the effect of

```cpp
c = str.rdbuf()->sbumpc();
```

for any sequences of characters; and the effect of pushing back a character `c` by

```cpp
ungetc(c, f);
```

is the same as the effect of

```cpp
str.rdbuf()->sputbackc(c);
```

for any sequence of characters.²⁶⁹

### 31.5.2.6 Storage functions

```cpp
static int xalloc();
```

**Returns:** index ++.

**Remarks:** Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

```cpp
long& iword(int idx);
```

** Preconditions:** idx is a value obtained by a call to `xalloc`.

**Effects:** If `iarray` is a null pointer, allocates an array of `long` of unspecified size and stores a pointer to its first element in `iarray`. The function then extends the array pointed at by `iarray` as necessary to

²⁶⁹ This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.
include the element \texttt{iarray[idx]}. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operation on the object.\footnote{An implementation is free to implement both the integer array pointed at by \texttt{iarray} and the pointer array pointed at by \texttt{parray} as sparse data structures, possibly with a one-element cache for each.} However, the value of the storage referred to is retained, so that until the next call to \texttt{copyfmt}, calling \texttt{iword} with the same index yields another reference to the same value. If the function fails\footnote{For example, because it cannot allocate space.} and \texttt{*this} is a base class subobject of a \texttt{basic_ios<>} object or subobject, the effect is equivalent to calling \texttt{basic_ios<>::setstate(badbit)} on the derived object (which may throw \texttt{failure}).

\begin{Verbatim}
void* pword(int idx);
\end{Verbatim}

\textbf{Returns:} On success \texttt{iarray[idx]}. On failure, a valid \texttt{long\&} initialized to 0.

\begin{Verbatim}
31.5.2.7 Callbacks
\end{Verbatim}

\begin{Verbatim}
void register_callback(event_callback fn, int idx);
\end{Verbatim}

\textbf{Preconditions:} The function \texttt{fn} does not throw exceptions.

\textbf{Effects:} Registers the pair (\texttt{fn, idx}) such that during calls to \texttt{imbue()} (31.5.2.4), \texttt{copyfmt()}, or \texttt{~ios_base()} (31.5.2.8), the function \texttt{fn} is called with argument \texttt{idx}. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

\textbf{Remarks:} Identical pairs are not merged. A function registered twice will be called twice.

\begin{Verbatim}
31.5.2.8 Constructors and destructor
\end{Verbatim}

\begin{Verbatim}
ios_base();
\end{Verbatim}

\textbf{Effects:} Each \texttt{ios_base} member has an indeterminate value after construction. The object’s members shall be initialized by calling \texttt{basic_ios::init} before the object’s first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

\begin{Verbatim}
~ios_base();
\end{Verbatim}

\textbf{Effects:} Calls each registered callback pair (\texttt{fn, idx}) (31.5.2.7) as (**fn)(erase_event, *this, idx) at such time that any \texttt{ios_base} member function called from within \texttt{fn} has well-defined results. Then, any memory obtained is deallocated.

\section{Class template fpos}

\begin{Verbatim}
namespace std {
  template<class stateT> class fpos {
    public:
      // 31.5.3.1, members
      stateT state() const;
      void state(stateT);
  }
}\end{Verbatim}

\footnote{An implementation is free to implement both the integer array pointed at by \texttt{iarray} and the pointer array pointed at by \texttt{parray} as sparse data structures, possibly with a one-element cache for each.}

\footnote{For example, because it cannot allocate space.}

\footnote{For example, because it cannot allocate space.}
private:
    stateT st; // exposition only
};

31.5.3.1 Members

void state(stateT s);
1
    Effects: Assigns s to st.

stateT state() const;
2
    Returns: Current value of st.

31.5.3.2 Requirements

An fpos type specifies file position information. It holds a state object whose type is equal to the template parameter stateT. Type stateT shall meet the Cpp17DefaultConstructible (Table 30), Cpp17CopyConstructible (Table 32), Cpp17CopyAssignable (Table 34), and Cpp17Destructible (Table 35) requirements. If is_trivially_copy_constructible_v<stateT> is true, then fpos<stateT> has a trivial copy constructor. If is_trivially_copyAssignable_v<stateT> is true, then fpos<stateT> has a trivial copy assignment operator. If is_trivially_destructible_v<stateT> is true, then fpos<stateT> has a trivial destructor. All specializations of fpos meet the Cpp17DefaultConstructible, Cpp17CopyConstructible, Cpp17CopyAssignable, Cpp17Destructible, and Cpp17EqualityComparable (Table 28) requirements. In addition, the expressions shown in Table 123 are valid and have the indicated semantics. In that table,

(1.1) — P refers to a specialization of fpos,
(1.2) — p and q refer to values of type P or const P,
(1.3) — pl and ql refer to modifiable lvalues of type P,
(1.4) — 0 refers to type streamoff, and
(1.5) — o and o2 refer to values of type streamoff or const streamoff.

</table>

§ 31.5.3.2 1657
Stream operations that return a value of type `traits::pos_type` return `P(0(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

### 31.5.4 Class template basic_ios

#### 31.5.4.1 Overview

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ios : public ios_base {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.5.4.4, flags functions
            explicit operator bool() const;
            bool operator!() const;
            iostate rdstate() const;
            void clear(iostate state = goodbit);
            void setstate(iostate state);
            bool good() const;
            bool eof() const;
            bool fail() const;
            bool bad() const;
            iostate exceptions() const;
            void exceptions(iostate except);

            // 31.5.4.2, constructor/destructor
            explicit basic_ios(basic_streambuf<charT, traits>* sb);
            virtual ~basic_ios();

            // 31.5.4.3, members
            basic_ostream<charT, traits>* tie() const;
            basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
            basic_streambuf<charT, traits>* rdbuf() const;
            basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
            basic_ios& copyfmt(const basic_ios& rhs);
            char_type fill() const;
            char_type fill(char_type ch);
            locale imbue(const locale& loc);
            char narrow(char_type c, char dfault) const;
            char_type widen(char c) const;
            basic_ios(const basic_ios&) = delete;
            basic_ios& operator=(const basic_ios&) = delete;
    }
}
```
protected:
    basic_ios();
    void init(basic_streambuf<charT, traits>* sb);
    void move(basic_ios& rhs);
    void move(basic_ios&& rhs);
    void swap(basic_ios& rhs) noexcept;
    void set_rdbuf(basic_streambuf<charT, traits>* sb);
};

31.5.4.2 Constructors

explicit basic_ios(basic_streambuf<charT, traits>* sb);

Effects: Assigns initial values to its member objects by calling init(sb).

basic_ios();

Effects: Leaves its member objects uninitialized. The object shall be initialized by calling basic_ios::init before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

~basic_ios();

Remarks: The destructor does not destroy rdbuf().

void init(basic_streambuf<charT, traits>* sb);

Postconditions: The postconditions of this function are indicated in Table 124.

Table 124: basic_ios::init() effects

</table>

31.5.4.3 Member functions

basic_ostream<charT, traits>* tie() const;

Returns: An output sequence that is tied to (synchronized with) the sequence controlled by the stream buffer.

basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

Preconditions: If tiestr is not null, tiestr is not reachable by traversing the linked list of tied stream objects starting from tiestr->tie().

Postconditions: tiestr == tie().

Returns: The previous value of tie().

basic_streambuf<charT, traits>* rdbuf() const;

Returns: A pointer to the streambuf associated with the stream.
basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

Effects: Calls clear().
Postconditions: sb == rdbuf().
Returns: The previous value of rdbuf().

locale imbue(const locale& loc);

Effects: Calls ios_base::imbue(loc) (31.5.2.4) and if rdbuf() != 0 then rdbuf()->pubimbue(loc) (31.6.3.3.1).
Returns: The prior value of ios_base::imbue().

char narrow(char_type c, char dfault) const;
Returns: use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)

char_type widen(char c) const;
Returns: use_facet<ctype<char_type>>(getloc()).widen(c)

char_type fill() const;
Returns: The character used to pad (fill) an output conversion to the specified field width.

char_type fill(char_type fillch);
Postconditions: traits::eq(fillch, fill())
Returns: The previous value of fill().

basic_ios& copyfmt(const basic_ios& rhs);

Effects: If (this == addressof(rhs)) is true does nothing. Otherwise assigns to the member objects of *this the corresponding member objects of rhs as follows:
(16.1) calls each registered callback pair (fn, idx) as (*fn)(erase_event, *this, idx);
(16.2) then, assigns to the member objects of *this the corresponding member objects of rhs, except that
(16.2.1) rdstate(), rdbuf(), and exceptions() are left unchanged;
(16.2.2) the contents of arrays pointed at by pword and iword are copied, not the pointers themselves;\textsuperscript{273} and
(16.2.3) if any newly stored pointer values in *this point at objects stored outside the object rhs and those objects are destroyed when rhs is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
(16.3) then, calls each callback pair that was copied from rhs as (*fn)(copyfmt_event, *this, idx);
(16.4) then, calls exceptions(rhs.exceptions()).
[Note 1: The second pass through the callback pairs permits a copied pword value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — end note]
Postconditions: The postconditions of this function are indicated in Table 125.
Returns: *this.

void move(basic_ios& rhs);
void move(basic_ios&& rhs);

Postconditions: *this has the state that rhs had before the function call, except that rdbuf() returns nullptr. rhs is in a valid but unspecified state, except that rhs.rdbuf() returns the same value as it returned before the function call, and rhs.tie() returns nullptr.

\textsuperscript{273} This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

§ 31.5.4.3 1660
void swap(basic_ios& rhs) noexcept;

Effects: The states of *this and rhs are exchanged, except that rdbuf() returns the same value as it returned before the function call, and rhs.rdbuf() returns the same value as it returned before the function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);

Preconditions: sb != nullptr is true.

Effects: Associates the basic_streambuf object pointed to by sb with this stream without calling clear().

Postconditions: rdbuf() == sb is true.

Throws: Nothing.

31.5.4.4 Flags functions

explicit operator bool() const;

Returns: !fail().

bool operator!() const;

Returns: fail().

iostate rdstate() const;

Returns: The error state of the stream buffer.

void clear(iostate state = goodbit);

Effects: If ((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0, returns. Otherwise, the function throws an object of class ios_base::failure (31.5.2.2.1), constructed with implementation-defined argument values.

Postconditions: If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state | ios_base::badbit).

void setstate(iostate state);

Effects: Calls clear(rdstate() | state) (which may throw ios_base::failure (31.5.2.2.1)).

bool good() const;

Returns: rdstate() == 0.

bool eof() const;

Returns: true if eofbit is set in rdstate().

bool fail() const;

Returns: true if failbit or badbit is set in rdstate().

274) Checking badbit also for fail() is historical practice.
bool bad() const;
    
Returns: true if badbit is set in rdstate().

iosstate exceptions() const;
    
Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

void exceptions(iostate except);
    
Effects: Calls clear(rdstate()).
Postconditions: except == exceptions().

31.5.5 ios_base manipulators
[std.ios.manip]
31.5.5.1 fmtflags manipulators [fmtflags.manip]

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& boolalpha(ios_base& str);
    
Effects: Calls str.setf(ios_base::boolalpha).
Returns: str.

ios_base& noboolalpha(ios_base& str);
    
Effects: Calls str.unsetf(ios_base::boolalpha).
Returns: str.

ios_base& showbase(ios_base& str);
    
Effects: Calls str.setf(ios_base::showbase).
Returns: str.

ios_base& noshowbase(ios_base& str);
    
Effects: Calls str.unsetf(ios_base::showbase).
Returns: str.

ios_base& showpoint(ios_base& str);
    
Effects: Calls str.setf(ios_base::showpoint).
Returns: str.

ios_base& noshowpoint(ios_base& str);
    
Effects: Calls str.unsetf(ios_base::showpoint).
Returns: str.

ios_base& showpos(ios_base& str);
    
Effects: Calls str.setf(ios_base::showpos).
Returns: str.

ios_base& noshowpos(ios_base& str);
    
Effects: Calls str.unsetf(ios_base::showpos).
Returns: str.

ios_base& skipws(ios_base& str);
    
Effects: Calls str.setf(ios_base::skipws).
Returns: str.

ios_base& noskipws(ios_base& str);
    
Effects: Calls str.unsetf(ios_base::skipws).
Returns: str.
ios_base& uppercase(ios_base& str);
   Effects: Calls str.setf(ios_base::uppercase).
   Returns: str.

ios_base& nouppercase(ios_base& str);
   Effects: Calls str.unsetf(ios_base::uppercase).
   Returns: str.

ios_base& unitbuf(ios_base& str);
   Effects: Calls str.setf(ios_base::unitbuf).
   Returns: str.

ios_base& nounitbuf(ios_base& str);
   Effects: Calls str.unsetf(ios_base::unitbuf).
   Returns: str.

31.5.5.2 adjustfield manipulators
   Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& internal(ios_base& str);
   Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).
   Returns: str.

ios_base& left(ios_base& str);
   Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).
   Returns: str.

ios_base& right(ios_base& str);
   Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).
   Returns: str.

31.5.5.3 basefield manipulators
   Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& dec(ios_base& str);
   Effects: Calls str.setf(ios_base::dec, ios_base::basefield).
   Returns: str.

ios_base& hex(ios_base& str);
   Effects: Calls str.setf(ios_base::hex, ios_base::basefield).
   Returns: str.

ios_base& oct(ios_base& str);
   Effects: Calls str.setf(ios_base::oct, ios_base::basefield).
   Returns: str.

31.5.5.4 floatfield manipulators
   Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& fixed(ios_base& str);
   Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).
   Returns: str.

275) The function signature dec(ios_base&) can be called by the function signature basic_ostream& stream::operator<<(ios_base& (*)(ios_base&)) to permit expressions of the form cout << dec to change the format flags stored in cout.

§ 31.5.5.4
```cpp
ios_base& scientific(ios_base& str);

   Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).

   Returns: str.

ios_base& hexfloat(ios_base& str);

   Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).

   Returns: str.

   [Note 1: ios_base::hex cannot be used to specify a hexadecimal floating-point format, because it is not part of ios_base::floatfield (Table 119). — end note]

ios_base& defaultfloat(ios_base& str);

   Effects: Calls str.unsetf(ios_base::floatfield).

   Returns: str.
```

### 31.5.6 Error reporting

```cpp
error_code make_error_code(io_errc e) noexcept;

   Returns: error_code(static_cast<int>(e), iostream_category()).
```

```cpp
error_condition make_error_condition(io_errc e) noexcept;

   Returns: error_condition(static_cast<int>(e), iostream_category()).
```

```cpp
const error_category& iostream_category() noexcept;

   Returns: A reference to an object of a type derived from class error_category.
```

The object’s default_error_condition and equivalent virtual functions shall behave as specified for the class error_category. The object’s name virtual function shall return a pointer to the string "iostream".

### 31.6 Stream buffers

#### 31.6.1 Header <streambuf> synopsis

```cpp
namespace std {

   template<class charT, class traits = char_traits<charT>>
   class basic_streambuf;

   using streambuf = basic_streambuf<char>;

   using wstreambuf = basic_streambuf<wchar_t>;

}
```

The header `<streambuf>` defines types that control input from and output to character sequences.

#### 31.6.2 Stream buffer requirements

Stream buffers can impose various constraints on the sequences they control. Some constraints are:

1. The controlled input sequence can be not readable.
2. The controlled output sequence can be not writable.
3. The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
4. The controlled sequences can support operations directly to or from associated sequences.
5. The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.

Each sequence is characterized by three pointers which, if non-null, all point into the same charT array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

1. The beginning pointer, or lowest element address in the array (called xbeg here);
(2.2) — the next pointer, or next element address that is a current candidate for reading or writing (called \texttt{xnext} here);

(2.3) — the end pointer, or first element address beyond the end of the array (called \texttt{xend} here).

The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

(3.1) — If \texttt{xnext} is not a null pointer, then \texttt{xbeg} and \texttt{xend} shall also be non-null pointers into the same \texttt{charT}
array, as described above; otherwise, \texttt{xbeg} and \texttt{xend} shall also be null.

(3.2) — If \texttt{xnext} is not a null pointer and \texttt{xnext < xend} for an output sequence, then a write position is available. In this case, \texttt{*xnext} shall be assignable as the next element to write (to put, or to store a character value, into the sequence).

(3.3) — If \texttt{xnext} is not a null pointer and \texttt{xbeg < xnext} for an input sequence, then a putback position is available. In this case, \texttt{xnext[-1]} shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.

(3.4) — If \texttt{xnext} is not a null pointer and \texttt{xnext < xend} for an input sequence, then a read position is available. In this case, \texttt{*xnext} shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

31.6.3 Class template basic_streambuf

31.6.3.1 General

namespace std {
  
  template<class charT, class traits = char_traits<charT>>
  class basic_streambuf {
    public:
      using char_type = charT;
      using int_type = typename traits::int_type;
      using pos_type = typename traits::pos_type;
      using off_type = typename traits::off_type;
      using traits_type = traits;
      
      virtual ~basic_streambuf();

      // 31.6.3.1.1, locales
      locale pubimbue(const locale& loc);
      locale getloc() const;

      // 31.6.3.2, buffer and positioning
      basic_streambuf* pubsetbuf(char_type* s, streamsize n);
      pos_type pubseekoff(off_type off, ios_base::seekdir way,
                          ios_base::openmode which
                          = ios_base::in | ios_base::out);
      pos_type pubseekpos(pos_type sp,
                          ios_base::openmode which
                          = ios_base::in | ios_base::out);
      int pubsync();

      // get and put areas
      // 31.6.3.3, get area
      streamsize in_avail();
      int_type snextc();
      int_type sbumpc();
      int_type sgetc();
      streamsize sgetn(char_type* s, streamsize n);

      // 31.6.3.4, putback
      int_type sputbackc(char_type c);
      int_type sungetc();

      // 31.6.3.5, put area
      int_type sputc(char_type c);

  }
protected:
    basic_streambuf();
    basic_streambuf(const basic_streambuf& rhs);
    basic_streambuf& operator=(const basic_streambuf& rhs);

    void swap(basic_streambuf& rhs);

    // 31.6.3.4.2, get area access

    virtual int_type uflow();

    // 31.6.3.5.4, putback
    virtual int_type pbackfail(int_type c = traits::eof());

    // 31.6.3.5.5, put area
    virtual streamsize xsputn(const char_type* s, streamsize n);
    virtual int_type overflow(int_type c = traits::eof());
};

The class template basic_streambuf serves as an abstract base class for deriving various stream buffers whose objects each control two character sequences:

1. a character input sequence;
2. a character output sequence.

### 31.6.3.2 Constructors

```cpp
basic_streambuf();
```

**Effects:** Initializes:\n
276) The default constructor is protected for class basic_streambuf to assure that only objects for classes derived from this class can be constructed.
— all pointer member objects to null pointers,
— the getloc() member to a copy of the global locale, locale(), at the time of construction.

Remarks: Once the getloc() member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member imbue is called.

basic_streambuf(const basic_streambuf& rhs);

Postconditions:
(3.1)   ebak() == rhs.ebak()
(3.2)   gptr() == rhs.gptr()
(3.3)   egptr() == rhs.egptr()
(3.4)   pbase() == rhs.pbase()
(3.5)   pptr() == rhs.pptr()
(3.6)   eptr() == rhs.eptr()
(3.7)   getloc() == rhs.getloc()

Effects: None.

31.6.3.3 Public member functions

31.6.3.3.1 Locales
locale pubimbue(const locale& loc);

Effects: Calls imbue(loc).
Postconditions: loc == getloc().
Returns: Previous value of getloc().

locale getloc() const;

Returns: If pubimbue() has ever been called, then the last value of loc supplied, otherwise the current global locale, locale(), in effect at the time of construction. If called after pubimbue() has been called but before pubimbue has returned (i.e., from within the call of imbue()) then it returns the previous value.

31.6.3.3.2 Buffer management and positioning

basic_streambuf* pubsetbuf(char_type* s, streamsize n);

Returns: setbuf(s, n).

pos_type pubseekoff(off_type off, ios_base::seekdir way,
                   ios_base::openmode which
                   = ios_base::in | ios_base::out);

Returns: seekoff(off, way, which).

pos_type pubseekpos(pos_type sp,
                   ios_base::openmode which
                   = ios_base::in | ios_base::out);

Returns: seekpos(sp, which).

int pubsync();

Returns: sync().

31.6.3.3.3 Get area

streamsize in_avail();

Returns: If a read position is available, returns egptr() - gptr(). Otherwise returns showmanyc() (31.6.3.5.3).
int_type snextc();

Effects: Calls sbumpc().

Returns: If that function returns traits::eof(), returns traits::eof(). Otherwise, returns sgetc().

int_type sbumpc();

Effects: If the input sequence read position is not available, returns uflow(). Otherwise, returns traits::to_int_type(*gptr()) and increments the next pointer for the input sequence.

int_type sgetc();

Returns: If the input sequence read position is not available, returns underflow(). Otherwise, returns traits::to_int_type(*gptr()).

streamsize sgetn(char_type* s, streamsize n);

Returns: xsgetn(s, n).

31.6.3.3.4 Putback [streambuf.pub.pback]

int_type sputbackc(char_type c);  

Effects: If the input sequence putback position is not available, or if traits::eq(c, gptr()[-1]) is false, returns pbackfail(trait::to_int_type(c)). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

int_type sungetc();

Effects: If the input sequence putback position is not available, returns pbackfail(). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

31.6.3.3.5 Put area [streambuf.pub.put]

int_type sputc(char_type c);  

Effects: If the output sequence write position is not available, returns overflow(traits::to_int_type(c)). Otherwise, stores c at the next pointer for the output sequence, increments the pointer, and returns traits::to_int_type(c).

streamsize sputn(const char_type* s, streamsize n);

Returns: xsputn(s, n).

31.6.3.4 Protected member functions [streambuf.protected]

31.6.3.4.1 Assignment [streambuf.assign]

basic_streambuf& operator=(const basic_streambuf& rhs);

Postconditions:

(1.1) — eback() == rhs.eback()
(1.2) — gptr() == rhs.gptr()
(1.3) — egptr() == rhs.egptr()
(1.4) — pbase() == rhs.pbase()
(1.5) — pptr() == rhs.pptr()
(1.6) — epptr() == rhs.epptr()
(1.7) — getloc() == rhs.getloc()

Returns: *this.

void swap(basic_streambuf& rhs);

Effects: Swaps the data members of rhs and *this.
31.6.3.4.2 Get area access

char_type* eback() const;
1    \textit{Returns:} The beginning pointer for the input sequence.

char_type* gptr() const;
2    \textit{Returns:} The next pointer for the input sequence.

char_type* egptr() const;
3    \textit{Returns:} The end pointer for the input sequence.

void gbump(int n);
4    \textit{Effects:} Adds \( n \) to the next pointer for the input sequence.

void setg(char_type* beg, char_type* gnext, char_type* gend);
5    \textit{Postconditions:} \( \text{beg} == \text{eback()} \), \( \text{gnext} == \text{gptr()} \), and \( \text{gend} == \text{egptr()} \) are all true.

31.6.3.4.3 Put area access

char_type* pbase() const;
1    \textit{Returns:} The beginning pointer for the output sequence.

char_type* pptr() const;
2    \textit{Returns:} The next pointer for the output sequence.

char_type* epptr() const;
3    \textit{Returns:} The end pointer for the output sequence.

void pbump(int n);
4    \textit{Effects:} Adds \( n \) to the next pointer for the output sequence.

void setp(char_type* pbeg, char_type* pend);
5    \textit{Postconditions:} \( \text{pbeg} == \text{pbase()} \), \( \text{pbeg} == \text{pptr()} \), and \( \text{pend} == \text{epptr()} \) are all true.

31.6.3.5 Virtual functions

31.6.3.5.1 Locales

void imbue(const locale&);
1    \textit{Effects:} Change any translations based on locale.

\textit{Remarks:} Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from \texttt{streambuf} can safely cache results of calls to locale functions and to members of facets so obtained.

\textit{Default behavior:} Does nothing.

31.6.3.5.2 Buffer management and positioning

basic_streambuf* setbuf(char_type* s, streamsize n);
1    \textit{Effects:} Influences stream buffering in a way that is defined separately for each class derived from \texttt{basic_streambuf} in this Clause (31.8.2.5, 31.10.3.5).

\textit{Default behavior:} Does nothing. Returns this.

pos_type seekoff(off_type off, ios_base::seekdir way, 
2    ios_base::openmode which = ios_base::in | ios_base::out);

\textit{Effects:} Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from \texttt{basic_streambuf} in this Clause (31.8.2.5, 31.10.3.5).

\textit{Default behavior:} Returns \texttt{pos_type(off_type(-1))}.
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2, 31.10.3).

Default behavior: Returns pos_type(off_type(-1)).

int sync();

Effects: Synchronizes the controlled sequences with the arrays. That is, if pbase() is non-null the characters between pbase() and pptr() are written to the controlled sequence. The pointers may then be reset as appropriate.

Returns: -1 on failure. What constitutes failure is determined by each derived class (31.10.3.5).

Default behavior: Returns zero.

31.6.3.5.3 Get area

streamsize showmanyc();

Returns: An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to underflow() will not return traits::eof() until at least that number of characters have been extracted from the stream. If showmanyc() returns -1, then calls to underflow() or uflow() will fail.

Default behavior: Returns zero.

Remarks: Uses traits::eof().

streamsize xsgetn(char_type* s, streamsize n);

Effects: Assigns up to n characters to successive elements of the array whose first element is designated by s. The characters assigned are read from the input sequence as if by repeated calls to sbumpc(). Assigning stops when either n characters have been assigned or a call to sbumpc() would return traits::eof().

Returns: The number of characters assigned.

Remarks: Uses traits::eof().

int_type underflow();

The pending sequence of characters is defined as the concatenation of

- the empty sequence if gptr() is null, otherwise the characters in [gptr(), egptr()], followed by
- some (possibly empty) sequence of characters read from the input sequence.

The result character is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

The backup sequence is the empty sequence if eback() is null, otherwise the characters in [eback(), gptr()).

Effects: The function sets up the gptr() and egptr() such that if the pending sequence is non-empty, then egptr() is non-null and the characters in [gptr(), egptr()] are the characters in the pending sequence, otherwise either gptr() is null or gptr() == egptr().

If eback() and gptr() are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either

- the backup sequence contains at least gptr() - eback() characters, in which case the characters in [eback(), gptr()] agree with the last gptr() - eback() characters of the backup sequence, or
- the characters in [gptr() - n, gptr()] agree with the backup sequence (where n is the length of the backup sequence).

277) The morphemes of showmanyc are “es-how-many-see”, not “show-manic”.
278) underflow or uflow can fail by throwing an exception prematurely. The intention is not only that the calls will not return eof() but that they will return “immediately”.
279) Classes derived from basic_streambuf can provide more efficient ways to implement xsgetn() and xsputn() by overriding these definitions from the base class.
Returns: traits::to_int_type(c), where c is the first character of the pending sequence, without moving the input sequence position past it. If the pending sequence is null then the function returns traits::eof() to indicate failure.

Default behavior: Returns traits::eof().

Remarks: The public members of basic_streambuf call this virtual function only if gptr() is null or gptr() >= egptr().

int_type uflow();

Preconditions: The constraints are the same as for underflow(), except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

Default behavior: Calls underflow(). If underflow() returns traits::eof(), returns traits::eof(). Otherwise, returns the value of traits::to_int_type(*gptr()) and increments the value of the next pointer for the input sequence.

Returns: traits::eof() to indicate failure.

31.6.3.5.4 Putback [streambuf.virt.pback]

int_type pbackfail(int_type c = traits::eof());

The pending sequence is defined as for underflow(), with the modifications that

(1.1) — If traits::eq_int_type(c, traits::eof()) returns true, then the input sequence is backed up one character before the pending sequence is determined.

(1.2) — If traits::eq_int_type(c, traits::eof()) returns false, then c is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

Postconditions: On return, the constraints of gptr(), eback(), and pptr() are the same as for underflow().

Returns: traits::eof() to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. pbackfail() is called only when put back has really failed.

Returns some value other than traits::eof() to indicate success.

Default behavior: Returns traits::eof().

Remarks: The public functions of basic_streambuf call this virtual function only when gptr() is null, gptr() == eback(), or traits::eq(traits::to_char_type(c), gptr()[-1]) returns false. Other calls shall also satisfy that constraint.

31.6.3.5.5 Put area [streambuf.virt.put]

streamsize xsputn(const char_type* s, streamsize n);

Effects: Writes up to n characters to the output sequence as if by repeated calls to sputc(c). The characters written are obtained from successive elements of the array whose first element is designated by s. Writing stops when either n characters have been written or a call to sputc(c) would return traits::eof(). It is unspecified whether the function calls overflow() when pptr() == eptr() becomes true or whether it achieves the same effects by other means.

Returns: The number of characters written.

int_type overflow(int_type c = traits::eof());

Effects: Consumes some initial subsequence of the characters of the pending sequence. The pending sequence is defined as the concatenation of

(3.1) — the empty sequence if pbase() is null, otherwise the pptr() - pbase() characters beginning at pbase(), followed by

(3.2) — the empty sequence if traits::eq_int_type(c, traits::eof()) returns true, otherwise the sequence consisting of c.
**Preconditions:** Every overriding definition of this virtual function obeys the following constraints:

1. The effect of consuming a character on the associated output sequence is specified.

2. Let \( r \) be the number of characters in the pending sequence not consumed. If \( r \) is nonzero then \( \text{pbase()} \) and \( \text{pptr()} \) are set so that: \( \text{pptr()} - \text{pbase()} = r \) and the \( r \) characters starting at \( \text{pbase()} \) are the associated output stream. In case \( r \) is zero (all characters of the pending sequence have been consumed) then either \( \text{pbase()} \) is set to \( \text{nullptr} \), or \( \text{pbase()} \) and \( \text{pptr()} \) are both set to the same non-null value.

3. The function may fail if either appending some character to the associated output stream fails or if it is unable to establish \( \text{pbase()} \) and \( \text{pptr()} \) according to the above rules.

**Returns:** \( \text{traits::eof()} \) or throws an exception if the function fails.

Otherwise, returns some value other than \( \text{traits::eof()} \) to indicate success.

**Default behavior:** Returns \( \text{traits::eof()} \).

**Remarks:** The member functions \( \text{sputc()} \) and \( \text{sputn()} \) call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

### 31.7 Formatting and manipulators

#### 31.7.1 Header `<istream>` synopsis

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream;

    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_iostream;

    using iostream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    template<class Istream, class T>
    Istream&& operator>>(Istream&& is, T&& x);
}
```

#### 31.7.2 Header `<ostream>` synopsis

```cpp

31.7.5 Input streams

31.7.5.1 General

1 The header `<istream>` defines two class templates and a function template that control input from a stream buffer, along with a function template that extracts from stream rvalues.

31.7.5.2 Class template basic_istream

31.7.5.2.1 General

1 When a function is specified with a type placeholder of `extended-floating-point-type`, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2) in lieu of `extended-floating-point-type`.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream : virtual public basic_ios<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 31.7.5.2.2, constructor/destructor
        explicit basic_istream(basic_streambuf<charT, traits>* sb);
        virtual ~basic_istream();

        // 31.7.5.3, formatted input
        basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
        basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
        basic_istream& operator>>(ios_base& (*pf)(ios_base&));
        basic_istream& operator>>(bool& n);
        basic_istream& operator>>(short& n);
        basic_istream& operator>>(unsigned short& n);
        basic_istream& operator>>(int& n);
        basic_istream& operator>>(unsigned int& n);
        basic_istream& operator>>(long& n);
        basic_istream& operator>>(unsigned long& n);
        basic_istream& operator>>(long long& n);
        basic_istream& operator>>(unsigned long long& n);
        basic_istream& operator>>(float& f);
        basic_istream& operator>>(double& f);
        basic_istream& operator>>(long double& f);
        basic_istream& operator>>(extended-floating-point-type& f);

        basic_istream& operator>>(void*& p);
        basic_istream& operator>>(basic_streambuf<char_type, traits>* sb);

        // 31.7.5.4, unformatted input
        streamsize gcount() const;
        int_type get();
        basic_istream& get(char_type& c);
        basic_istream& get(char_type* s, streamsize n);
    }
```
basic_istream& get(char_type* s, streamsize n, char_type delim);
basic_istream& get(basic_streambuf<char_type, traits>& sb);
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

basic_istream& getline(char_type* s, streamsize n);
basic_istream& getline(char_type* s, streamsize n, char_type delim);

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
int_type peek();
basic_istream& read (char_type* s, streamsize n);
streamsize readsome(char_type* s, streamsize n);

basic_istream& putback(char_type c);
basic_istream& unget();
int sync();
pos_type tellg();
basic_istream& seekg(pos_type);
basic_istream& seekg(off_type, ios_base::seekdir);

protected:
  // 31.7.5.2.2, copy/move constructor
  basic_istream(const basic_istream&) = delete;
basic_istream(basic_istream&& rhs);

  // 31.7.5.2.3, assignment and swap
  basic_istream& operator=(const basic_istream&) = delete;
basic_istream& operator=(basic_istream&& rhs);
  void swap(basic_istream& rhs);
};

# 31.7.5.3.3, character extraction templates

template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);
template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char(&)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char(&)[N]);

2 The class template basic_istream defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.

3 Two groups of member function signatures share common properties: the formatted input functions (or extractors) and the unformatted input functions. Both groups of input functions are described as if they obtain (or extract) input characters by calling rdbuf()->sbumpc() or rdbuf()->sgetc(). They may use other public members of istream.

31.7.5.2.2 Constructors

explicit basic_istream(basic_streambuf<charT, traits>* sb);

Effects: Initializes the base class subobject with basic_ios::init(sb) (31.5.4.2).
Postconditions: gcount() == 0.

basic_istream(basic_istream&& rhs);

Effects: Default constructs the base class, copies the gcount() from rhs, calls basic_ios<charT, traits>::move(rhs) to initialize the base class, and sets the gcount() for rhs to 0.
virtual ~basic_istream();

Remarks: Does not perform any operations of rdbuf().

### 31.7.5.2.3 Assignment and swap

```cpp
basic_istream& operator=(basic_istream&& rhs);
```

**Effects**: Equivalent to swap(rhs).

**Returns**: *this.

### 31.7.5.2.4 Class basic_istream::sentry

```cpp
namespace std {
    template<class charT, class traits>
    class basic_istream<charT, traits>::sentry {
    private:
        bool ok_;           // exposition only

    public:
        explicit sentry(basic_istream& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```cpp
explicit sentry(basic_istream& is, bool noskipws = false);
```

**Effects**: If `is.good()` is false, calls `setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.\(^{282}\) If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbumpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

**Remarks**: The constructor

```cpp
explicit sentry(basic_istream& is, bool noskipws = false)
```

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```cpp
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // c is a whitespace character.
```

If, after any preparation is completed, `is.good()` is true, `ok_` != false otherwise, `ok_` == false. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure (31.5.4.4)`).\(^{283}\)

---

\(^{282}\) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

\(^{283}\) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.
31.7.5.3 Formatted input functions

31.7.5.3.1 Common requirements

Each formatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false` when converted to a value of type `bool`, the function returns without attempting to obtain any input. If `rdbuf()->sgetc()` or `rdbuf()->sbumpc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

31.7.5.3.2 Arithmetic extractors

As in the case of the inserters, these extractors depend on the locale's `num_get<>` (30.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.5.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment, where `state` represents the input function's local error state:

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
use_facet<numget>(loc).get(*this, 0, *this, state, val);
```

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

[Note 1: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. —end note]

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<short>::min()) {
    state |= ios_base::failbit;
    val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
    state |= ios_base::failbit;
    val = numeric_limits<short>::max();
} else
```
val = static_cast<short>(lval);

basic_istream& operator>>(int& val);
3 The conversion occurs as if performed by the following code fragment (using the same notation as for
the preceding code fragment):
   using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
   long lval;
   use_facet<numget>(loc).get(*this, 0, *this, state, lval);
   if (lval < numeric_limits<int>::min()) {
      state |= ios_base::failbit;
      val = numeric_limits<int>::min();
   } else if (numeric_limits<int>::max() < lval) {
      state |= ios_base::failbit;
      val = numeric_limits<int>::max();
   } else
      val = static_cast<int>(lval);

basic_istream& operator>>(extended-floating-point-type& val);
4 If the floating-point conversion rank of extended-floating-point-type is not less than or equal
to that of long double, then an invocation of the operator function is conditionally supported with
implementation-defined semantics.
5 Otherwise, let FP be a standard floating-point type:
(5.1) — if the floating-point conversion rank of extended-floating-point-type is less than or equal to
that of float, then FP is float,
(5.2) — otherwise, if the floating-point conversion rank of extended-floating-point-type is less than
or equal to that of double, then FP is double,
(5.3) — otherwise, FP is long double.
6 The conversion occurs as if performed by the following code fragment (using the same notation as for
the preceding code fragment):
   using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
   FP fval;
   use_facet<numget>(loc).get(*this, 0, *this, state, fval);
   if (fval < -numeric_limits<extended-floating-point-type>::max()) {
      state |= ios_base::failbit;
      val = -numeric_limits<extended-floating-point-type>::max();
   } else if (numeric_limits<extended-floating-point-type>::max() < fval) {
      state |= ios_base::failbit;
      val = numeric_limits<extended-floating-point-type>::max();
   } else {
      val = static_cast<extended-floating-point-type>(fval);
   }

[Note 2: When the extended floating-point type has a floating-point conversion rank that is not equal to
the rank of any standard floating-point type, then double rounding during the conversion can result in inaccurate
results. from_chars can be used in situations where maximum accuracy is important. — end note]

31.7.5.3.3 basic_istream::operator>>
[istream.extractors]

basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
1 Effects: None. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).
2 Returns: pf(*this). 284

basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
3 Effects: Calls pf(*this). This extractor does not behave as a formatted input function (as described
in 31.7.5.3.1).
4 Returns: *this.

284) See, for example, the function signature ws(basic_istream&) (31.7.5.5).
basic_istream& operator>>(ios_base& (*pf)(ios_base&));

Effects: Calls pf(*this). This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

Returns: *this.

template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);

Effects: Behaves like a formatted input member (as described in 31.7.5.3.1) of in. After a sentry object is constructed, operator>> extracts characters and stores them into s. If width() is greater than zero, n is min(size_t(width())), N. Otherwise n is N. n is the maximum number of characters stored.

Characters are extracted and stored until any of the following occurs:

(8.1) n-1 characters are stored;
(8.2) end of file occurs on the input sequence;
(8.3) letting ct be use_facet<ctype<charT>>(in.getloc()), ct.is(ct.space, c) is true.

operator>> then stores a null byte (charT()) in the next position, which may be the first position if no characters were extracted. operator>> then calls width(0).

If the function extracted no characters, ios_base::failbit is set in the input function’s local error state before setstate is called.

Returns: in.

template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);

Effects: Behaves like a formatted input member (as described in 31.7.5.3.1) of in. A character is extracted from in, if one is available, and stored in c. Otherwise, ios_base::failbit is set in the input function’s local error state before setstate is called.

Returns: in.

basic_istream& operator>>(basic_streambuf<charT, traits>* sb);

Effects: Behaves as an unformatted input function (31.7.5.4). If sb is null, calls setstate(failbit), which may throw ios_base::failure (31.5.4.4). After a sentry object is constructed, extracts characters from *this and inserts them in the output sequence controlled by sb. Characters are extracted and inserted until any of the following occurs:

(14.1) end-of-file occurs on the input sequence;
(14.2) inserting in the output sequence fails (in which case the character to be inserted is not extracted);
(14.3) an exception occurs (in which case the exception is caught).

If the function inserts no characters, ios_base::failbit is set in the input function’s local error state before setstate is called.

Returns: *this.

31.7.5.4 Unformatted input functions

Each unformatted input function begins execution by constructing an object of type ios_base::iostate, termed the local error state, and initializing it to ios_base::goodbit. It then creates an object of class sentry with the default argument noskipws (second) argument true. If the sentry object returns true,

285) See, for example, the function signature dec(ios_base&) (31.5.5.3).
when converted to a value of type \texttt{bool}, the function endeavors to obtain the requested input. Otherwise, if the \texttt{sentry} constructor exits by throwing an exception or if the \texttt{sentry} object produces \texttt{false}, when converted to a value of type \texttt{bool}, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using \texttt{charT()}) in the first location of the array. If \texttt{rdbuf()->sbumpc()} or \texttt{rdbuf()->sgetc()} returns \texttt{traits::eof()}, then \texttt{ios_base::eofbit} is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then \texttt{ios_base::badbit} is set in the local error state, \texttt{*this}'s error state is set to the local error state, and the exception is rethrown if \texttt{(exceptions() \& badbit)} \texttt{!= 0}. If no exception has been thrown it stores the number of characters extracted in a member object. After extraction is done, the input function calls \texttt{setstate}, which sets \texttt{*this}'s error state to the local error state, and may throw an exception. In any event the \texttt{sentry} object is destroyed before leaving the unformatted input function.

\begin{verbatim}
streamsize gcount() const;

Effects: None. This member function does not behave as an unformatted input function (as described above).

Returns: The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns \texttt{numeric_limits<streamsize>::max()}.

int_type get();

Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts a character \(c\), if one is available. Otherwise, \texttt{ios_base::failbit} is set in the input function’s local error state before \texttt{setstate} is called.

Returns: \(c\) if available, otherwise \texttt{traits::eof()}.

basic_istream& get(char_type& c);

Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts a character, if one is available, and assigns it to \(c\). Otherwise, \texttt{ios_base::failbit} is set in the input function’s local error state before \texttt{setstate} is called.

Returns: \(\ast\texttt{this}\).

basic_istream& get(char_type* s, streamsize n, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts characters and stores them into successive locations of an array whose first element is designated by \(s\). Characters are extracted and stored until any of the following occurs:

\begin{enumerate}
\item \(n\) is less than one or \(n - 1\) characters are stored;
\item end-of-file occurs on the input sequence;
\item \texttt{traits::eq}(c, \texttt{delim}) for the next available input character \(c\) (in which case \(c\) is not extracted).
\end{enumerate}

If the function stores no characters, \texttt{ios_base::failbit} is set in the input function’s local error state before \texttt{setstate} is called. In any case, if \(n\) is greater than zero it then stores a null character into the next successive location of the array.

Returns: \(\ast\texttt{this}\).

basic_istream& get(char_type* s, streamsize n);

Effects: Calls \texttt{get(s, n, widen(‘\n’)\n
Returns: Value returned by the call.

basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts characters and inserts them in the output sequence controlled by \(sb\). Characters are extracted and inserted until any of the following occurs:

\begin{enumerate}
\item end-of-file occurs on the input sequence;
\end{enumerate}

\end{verbatim}

\footnotesize
\begin{enumerate}
\item Note that this function is not overloaded on types \texttt{signed char} and \texttt{unsigned char}.
\item Note that this function is not overloaded on types \texttt{signed char} and \texttt{unsigned char}.
\end{enumerate}
— inserting in the output sequence fails (in which case the character to be inserted is not extracted);
— `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted);
— an exception occurs (in which case, the exception is caught but not rethrown).

If the function inserts no characters, `ios_base::failbit` is set in the input function’s local error state before `setstate` is called.

Returns: *this.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb);
```

Effects: Calls `get(sb, widen(‘\n’))`.

Returns: Value returned by the call.

```
basic_istream& getline(char_type* s, streamsize n, char_type delim);
```

Effects: Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.\(^{288}\) Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence;
2. `traits::eq(c, delim)` for the next available input character `c` (in which case the input character is extracted but not stored);\(^{289}\)
3. `n` is less than one or `n - 1` characters are stored (in which case the function calls `setstate(failbit)`).

These conditions are tested in the order shown.\(^{290}\)

If the function extracts no characters, `ios_base::failbit` is set in the input function’s local error state before `setstate` is called.\(^{291}\)

In any case, if `n` is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

Returns: *this.

[Example 1:]

```cpp
#include <iostream>

int main() {
  using namespace std;
  const int line_buffer_size = 100;

  char buffer[line_buffer_size];
  int line_number = 0;
  while ((cin.getline(buffer, line_buffer_size, ‘\n’) || cin.gcount()) {
    int count = cin.gcount();
    if (cin.eof())
      cout << "Partial final line"; // cin.fail() is false
    else if (cin.fail()) {
      cout << "Partial long line";
      cin.clear(cin.rdstate() & ~ios_base::failbit);
    } else {
      count--;
      // Don’t include newline in count
      cout << "Line " << ++line_number;
    }
    cout << " (" << count << " chars): " << buffer << endl;
  }
}
```

---

\(^{288}\) Note that this function is not overloaded on types `signed char` and `unsigned char`.

\(^{289}\) Since the final input character is “extracted”, it is counted in the `gcount()`, even though it is not stored.

\(^{290}\) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.

\(^{291}\) This implies an empty input line will not cause `failbit` to be set.
basic_istream& getline(char_type* s, streamsize n);

Returns: getline(s, n, widen('n'))

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:

- n != numeric_limits<streamsize>::max() (17.3.5) and n characters have been extracted so far
- end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit), which may throw ios_base::failure (31.5.4.4));
- traits::eq_int_type(traits::to_int_type(c), delim) for the next available input character c (in which case c is extracted).

[Note 1: The last condition will never occur if traits::eq_int_type(delim, traits::eof()). — end note]

Returns: *this.

int_type peek();

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.

Returns: traits::eof() if good() is false. Otherwise, returns rdbuf()->sgetc().

basic_istream& read(char_type* s, streamsize n);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. Characters are extracted and stored until either of the following occurs:

- n characters are stored;
- end-of-file occurs on the input sequence (in which case the function calls setstate(failbit | eofbit), which may throw ios_base::failure (31.5.4.4)).

Returns: *this.

streamsize readsome(char_type* s, streamsize n);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. If rdbuf()->in_avail() == -1, calls setstate(eofbit) (which may throw ios_base::failure (31.5.4.4)), and extracts no characters;

- If rdbuf()->in_avail() == 0, extracts no characters
- If rdbuf()->in_avail() > 0, extracts min(rdbuf()->in_avail(), n)).

Returns: The number of characters extracted.

basic_istream& putback(char_type c);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sputbackc(c). If rdbuf() is null, or if sputbackc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).

[Note 2: This function extracts no characters, so the value returned by the next call to gcount() is 0. — end note]

Returns: *this.

---

292) Note that this function is not overloaded on types signed char and unsigned char.
basic_istream& unget();

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sungetc(). If rdbuf() is null, or if sungetc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).

[Note 3: This function extracts no characters, so the value returned by the next call to gcount() is 0. — end note]

Returns: *this.

int sync();

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if rdbuf() is a null pointer, returns -1. Otherwise, calls rdbuf()->pubsync() and, if that function returns -1 calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4), and returns -1. Otherwise, returns zero.

pos_type tellg();

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to gcount().

Returns: After constructing a sentry object, if fail() != false, returns pos_type(-1) to indicate failure. Otherwise, returns rdbuf()->pubseekoff(0, cur, in).

basic_istream& seekg(pos_type pos);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if fail() != true, executes rdbuf()->pubseekpos(pos, ios_base::in). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

basic_istream& seekg(off_type off, ios_base::seekdir dir);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if fail() != true, executes rdbuf()->pubseekoff(off, dir, ios_base::in). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

31.7.5.5 Standard basic_istream manipulators [istream.manip]

Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

template<class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

Effects: Behaves as an unformatted input function (31.7.5.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to is.gcount(). After constructing a sentry object extracts characters as long as the next available character c is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by sentry::sentry (31.5.2.4). If ws stops extracting characters because there are no more available it sets eofbit, but not failbit.

Returns: is.
31.7.5.6 Rvalue stream extraction

```cpp
template<class Istream, class T>
Istream&& operator>>(Istream&& is, T&& x);
```

1 **Constraints:** The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand (7.2.3) and `Istream` is publicly and unambiguously derived from `ios_base`.

2 **Effects:** Equivalent to:
   ```cpp
   is >> std::forward<T>(x);
   return std::move(is);
   ```

31.7.5.7 Class template `basic_iostream`

31.7.5.7.1 General

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
        : public basic_istream<charT, traits>,
          public basic_ostream<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 31.7.5.7.2, constructor
        explicit basic_iostream(basic_streambuf<charT, traits>* sb);

        // 31.7.5.7.3, destructor
        virtual ~basic_iostream();
    protected:
        // 31.7.5.7.2, constructor
        basic_iostream(const basic_iostream&) = delete;
        basic_iostream(basic_iostream&& rhs);

        // 31.7.5.7.4, assignment and swap
        basic_iostream& operator=(const basic_iostream&) = delete;
        basic_iostream& operator=(basic_iostream&& rhs);
        void swap(basic_iostream& rhs);
    };
}
```

1 The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

31.7.5.7.2 Constructors

```cpp
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

1 **Effects:** Initializes the base class subobjects with `basic_istream<charT, traits>(sb)` (31.7.5.2) and `basic_ostream<charT, traits>(sb)` (31.7.6.2).

2 **Postconditions:** `rdbuf() == sb` and `gcount() == 0`.

3 **Effects:** Move constructs from the rvalue `rhs` by constructing the `basic_iostream` base class with `std::move(rhs)`.

31.7.5.7.3 Destructor

```cpp
virtual ~basic_iostream();
```

1 **Remarks:** Does not perform any operations on `rdbuf()`.

§ 31.7.5.7.3 1684
31.7.5.7.4 Assignment and swap

basic_iostream& operator=(basic_iostream&& rhs);

Effects: Equivalent to swap(rhs).

void swap(basic_iostream& rhs);

Effects: Calls basic_istream<charT, traits>::swap(rhs).

31.7.6 Output streams

31.7.6.1 General

The header <ostream> defines a class template and several function templates that control output to a stream buffer, along with a function template that inserts into stream rvalues.

31.7.6.2 Class template basic_ostream

31.7.6.2.1 General

When a function has a parameter type extended-floating-point-type, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2).

namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_ostream : virtual public basic_ios<charT, traits> {
  public:
    // types (inherited from basic_ios (31.5.4))
    using char_type = charT;
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;
    // 31.7.6.2.2, constructor/destructor
    explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
    virtual ~basic_ostream();
    // 31.7.6.2.4, prefix/suffix
    class sentry;
    // 31.7.6.3, formatted output
    basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
    basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
    basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
    basic_ostream& operator<<(bool n);
    basic_ostream& operator<<(short n);
    basic_ostream& operator<<(unsigned short n);
    basic_ostream& operator<<(int n);
    basic_ostream& operator<<(unsigned int n);
    basic_ostream& operator<<(long n);
    basic_ostream& operator<<(unsigned long n);
    basic_ostream& operator<<(long long n);
    basic_ostream& operator<<(unsigned long long n);
    basic_ostream& operator<<(float f);
    basic_ostream& operator<<(double f);
    basic_ostream& operator<<(long double f);
    basic_ostream& operator<<(extended-floating-point-type f);
    basic_ostream& operator<<(const void* p);
    basic_ostream& operator<<(const volatile void* p);
    basic_ostream& operator<<(nullptr_t);
    basic_ostream& operator<<(basic_streambuf<char_type, traits>* sb);
    // 31.7.6.4, unformatted output
    basic_ostream& put(char_type c);
    basic_ostream& write(const char_type* s, streamsize n);
  } // basic_ostream
};
basic_ostream& flush();

// 31.7.6.2.5, seeks
pos_type tellp();
basic_ostream& seekp(pos_type);
basic_ostream& seekp(off_type, ios_base::seekdir);

protected:
// 31.7.6.2.2, copy/move constructor
basic_ostream(const basic_ostream&) = delete;
basic_ostream(basic_ostream&& rhs);

// 31.7.6.2.3, assignment and swap
basic_ostream& operator=(const basic_ostream&) = delete;
basic_ostream& operator=(basic_ostream&& rhs);
void swap(basic_ostream& rhs);
};

// 31.7.6.3.4, character inserters
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, charT);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, char);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, char);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, signed char);
template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, unsigned char);

template<class traits>
  basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const charT*);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const charT*);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const signed char*);
template<class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, const unsigned char*);

§ 31.7.6.2.1
The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the formatted output functions (or `inserters`) and the unformatted output functions. Both groups of output functions generate (or `insert`) output characters by actions equivalent to calling `rdbuf()->sputc(int_type)`.

If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

[Note 1: The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers. —end note]

### 31.7.6.2.2 Constructors

```cpp
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

**Effects**: Initializes the base class subobject with `basic_ios<charT, traits>::init(sb)` (31.5.4.2).

**Postconditions**: `rdbuf() == sb`.

```cpp
basic_ostream(basic_ostream&& rhs);
```

**Effects**: Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class and calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class.

**Remarks**: Does not perform any operations on `rdbuf()`.

### 31.7.6.2.3 Assignment and swap

```cpp
basic_ostream& operator=(basic_ostream&& rhs);
```

**Effects**: Equivalent to `swap(rhs)`.

**Returns**: `*this`.

```cpp
void swap(basic_ostream& rhs);
```

**Effects**: Calls `basic_ios<charT, traits>::swap(rhs)`.

### 31.7.6.2.4 Class `basic_ostream::sentry`

```cpp
namespace std {
    template<class charT, class traits>
    class basic_ostream<charT, traits>::sentry {
        § 31.7.6.2.4 1687
```
bool ok_; // exposition only

public:
    explicit sentry(basic_ostream& os);
    ~sentry();
    explicit operator bool() const { return ok_; }

    sentry(const sentry&) = delete;
    sentry& operator=(const sentry&) = delete;
};

The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```cpp
explicit sentry(basic_ostream& os);
```

If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.

```cpp
~sentry();
```

If, after any preparation is completed, `os.good()` is true, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure`).

```cpp
explicit operator bool() const;
```

Effects: Returns `ok_`.

### 31.7.6.2.5 Seek members

Each seek member function begins execution by constructing an object of class `sentry`. It returns by destroying the `sentry` object.

```cpp
pos_type tellp();
```

Returns: If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

```cpp
basic_ostream& seekp(pos_type pos);
```

Effects: If `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

Returns: `*this`.

```cpp
basic_ostream& seekp(off_type off, ios_base::seekdir dir);
```

Effects: If `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

Returns: `*this`.

### 31.7.6.3 Formatted output functions

#### 31.7.6.3.1 Common requirements

Each formatted output function begins execution by constructing an object of class `sentry`. If that object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`, which can throw an exception. If an exception is thrown during output, then `ios_base::badbit` is set in `*this`’s error state. If `(exceptions()&badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.

293) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.

294) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

295) This is done without causing an `ios_base::failure` to be thrown.
The descriptions of the individual formatted output functions describe how they perform output and do not mention the *sentry* object.

If a formatted output function of a stream *os* determines padding, it does so as follows. Given a `charT` character sequence *seq* where `charT` is the character type of the stream, if the length of *seq* is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is true, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

### 31.7.6.3.2 Arithmetic inserter

```
operator<<(bool val);
operator<<(short val);
operator<<(unsigned short val);
operator<<(int val);
operator<<(unsigned int val);
operator<<(long val);
operator<<(unsigned long val);
operator<<(long long val);
operator<<(unsigned long long val);
operator<<(float val);
operator<<(double val);
operator<<(long double val);
operator<<(const void* val);
```

**Effects:** The classes `num_get<>` and `num_put<>` handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued `locale` value to perform numeric formatting. When `val` is of type `bool, long, unsigned long, long long, unsigned long long, double, long double, or const void*`, the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(
        getloc() ).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```cpp
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(
        getloc() ).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
            ? static_cast<long>(static_cast<unsigned short>(val))
            : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```cpp
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(
        getloc() ).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
            ? static_cast<long>(static_cast<unsigned int>(val))
            : static_cast<long>(val)).failed();
```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(
        getloc() ).put(*this, *this, fill(),
        static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(
        getloc() ).put(*this, *this, fill(),
```
static_cast<double>(val)).failed();

The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<`. It bypasses `ostream` and uses `streambufs` directly. Class `locale` relies on these types as its interface to iostreams, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

Returns: *this.

basic_ostream& operator<<(const volatile void* p);

Effects: Equivalent to: return operator<<(const_cast<const void*>(p));

basic_ostream& operator<<(extended-floating-point-type val);

Effects: If the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `double`, the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
>(getloc()).put(*this, *this, fill(),
    static_cast<double>(val)).failed();
```

Otherwise, if the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `long double`, the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
>(getloc()).put(*this, *this, fill(),
    static_cast<long double>(val)).failed();
```

Otherwise, an invocation of the operator function is conditionally supported with implementation-defined semantics.

If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

Returns: *this.

31.7.6.3.3 basic_ostream::operator<< [ostream.inserters]

basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));

1 Effects: None. Does not behave as a formatted output function (as described in 31.7.6.3.1).

2 Returns: pf(*this).

basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));

3 Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

4 Returns: *this.

basic_ostream& operator<<(ios_base& (*pf)(ios_base&));

5 Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

6 Returns: *this.

basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);

7 Effects: Behaves as an unformatted output function (31.7.6.4). After the `sentry` object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

8 Gets characters from `sb` and inserts them in *this. Characters are read from `sb` and inserted until any of the following occurs:

---

296) See, for example, the function signature `endl(basic_ostream&)` (31.7.6.5).
297) See, for example, the function signature `dec(ios_base&)` (31.5.5.3).
— end-of-file occurs on the input sequence;
— inserting in the output sequence fails (in which case the character to be inserted is not extracted);
— an exception occurs while getting a character from \texttt{sb}.

If the function inserts no characters, it calls \texttt{setstate(failbit)} (which may throw \texttt{ios\_base::failure (31.5.4.4)}). If an exception was thrown while extracting a character, the function sets \texttt{failbit} in the error state, and if \texttt{failbit} is set in \texttt{exceptions()} the caught exception is rethrown.

\textit{Returns:} \texttt{*this}.

\begin{verbatim}
basic_ostream\& operator<<(nullptr_t);
\end{verbatim}

\textit{Effects:} Equivalent to:
\begin{verbatim}
return *this << s;
\end{verbatim}

where \texttt{s} is an implementation-defined NTCTS (3.36).

\subsection*{31.7.6.3.4 Character inserter function templates
[ostream.inserters.character]}

\begin{verbatim}
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);

// specialization
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
// signed and unsigned
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);

// signed and unsigned
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);
\end{verbatim}

\textit{Effects:} Behaves as a formatted output function (31.7.6.3.1) of \texttt{out}. Constructs a character sequence \texttt{seq}. If \texttt{c} has type \texttt{char} and the character type of the stream is not \texttt{char}, then \texttt{seq} consists of \texttt{out.widen(c)}; otherwise \texttt{seq} consists of \texttt{c}. Determines padding for \texttt{seq} as described in 31.7.6.3.1. Inserts \texttt{seq} into \texttt{out}. Calls \texttt{os.width(0)}.

\textit{Returns:} \texttt{out}.

\begin{verbatim}
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT\* s);

// specialization
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char\* s);
// signed and unsigned
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char\* s);

// signed and unsigned
template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const unsigned char\* s);
\end{verbatim}

\textit{Preconditions:} \texttt{s} is not a null pointer.

\textit{Effects:} Behaves like a formatted inserter (as described in 31.7.6.3.1) of \texttt{out}. Creates a character sequence \texttt{seq} of \texttt{n} characters starting at \texttt{s}, each widened using \texttt{out.widen()} (31.5.4.3), where \texttt{n} is the number that would be computed as if by:

\begin{itemize}
  \item traits::length(s) for the overload where the first argument is of type \texttt{basic\_ostream<charT, traits>\&} and the second is of type \texttt{const charT\*}, and also for the overload where the first argument is of type \texttt{basic\_ostream<char, traits>\&} and the second is of type \texttt{const char*},
  \item char_traits<char>::length(s) for the overload where the first argument is of type \texttt{basic\_ostream<char, traits>\&} and the second is of type \texttt{const char*},
  \item traits::length(reinterpret_cast<const char*>(s)) for the other two overloads.
\end{itemize}

Determines padding for \texttt{seq} as described in 31.7.6.3.1. Inserts \texttt{seq} into \texttt{out}. Calls \texttt{width(0)}.

\textit{Returns:} \texttt{out}.
31.7.6.3.5 Print

template<class... Args>
void print(ostream& os, format_string<Args...> fmt, Args&&... args);

Effects: If the ordinary literal encoding (5.3) is UTF-8, equivalent to:

vprint_unicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));

Otherwise, equivalent to:

vprint_nonunicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));

template<class... Args>
void println(ostream& os, format_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:

print(os, "\n", format(fmt, std::forward<Args>(args)...));

void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);

Effects: Behaves as a formatted output function (31.7.6.3.1) of os, except that:

1 (3.1) failure to generate output is reported as specified below, and
2 (3.2) any exception thrown by the call to vformat is propagated without regard to the value of os.exceptions() and without turning on ios_base::badbit in the error state of os.

After constructing a sentry object, the function initializes an automatic variable via

string out = vformat(os.getloc(), fmt, args);

If the function is vprint_unicode and os is a stream that refers to a terminal capable of displaying Unicode which is determined in an implementation-defined manner, writes out to the terminal using the native Unicode API; if out contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. If the native Unicode API is used, the function flushes os before writing out. Otherwise (if os is not such a stream or the function is vprint_nonunicode), inserts the character sequence [out.begin(), out.end()) into os. If writing to the terminal or inserting into os fails, calls os.setstate(ios_base::badbit) (which may throw ios_base::failure).

Recommended practice: For vprint_unicode, if invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with u+fffd replacement character per the Unicode Standard, Chapter 3.9 u+fffd Substitution in Conversion.

31.7.6.4 Unformatted output functions

basic_ostream& put(char_type c);

Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, inserts the character c, if possible.

Otherwise, calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).

Returns: *this.

basic_ostream& write(const char_type* s, streamsize n);

Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, obtains characters to insert from successive locations of an array whose first element is designated by s. Characters are inserted until either of the following occurs:

1 n characters are inserted;

5 298) This is done without causing an ios_base::failure to be thrown.
299) Note that this function is not overloaded on types signed char and unsigned char.
300) Note that this function is not overloaded on types signed char and unsigned char.
— inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (31.5.4.4)).

6 Returns: *this.

```cpp
basic_ostream& flush();
```

7 Effects: Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a sentry object. If that object returns `true` when converted to a value of type `bool` the function calls `rdbuf()->pubsync()`. If that function returns −1 calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)). Otherwise, if the sentry object returns `false`, does nothing.

8 Returns: *this.

### 31.7.6.5 Standard manipulators [ostream.manip]

Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

```cpp
template<class charT, class traits>
  basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);  
```  
2 Effects: Calls `os.put(os.widen(’\n’))`, then `os.flush()`.

3 Returns: os.

```cpp
template<class charT, class traits>
  basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);  
```  
4 Effects: Inserts a null character into the output sequence: calls `os.put(charT())`.

5 Returns: os.

```cpp
template<class charT, class traits>
  basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);  
```  
6 Effects: Calls `os.flush()`.

7 Returns: os.

```cpp
template<class charT, class traits>
  basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);  
```  
8 Effects: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>`, called buf for the purpose of exposition, calls `buf->set_emit_on_sync(true)`. Otherwise this manipulator has no effect.

[Note 1: To work around the issue that the Allocator template argument cannot be deduced, implementations can introduce an intermediate base class to `basic_syncbuf` that manages its `emit_on_sync` flag. — end note]

9 Returns: os.

```cpp
template<class charT, class traits>
  basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);  
```  
10 Effects: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>`, called buf for the purpose of exposition, calls `buf->set_emit_on_sync(false)`. Otherwise this manipulator has no effect.

11 Returns: os.

```cpp
template<class charT, class traits>
  basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);  
```  
12 Effects: Calls `os.flush()`. Then, if `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>`, called buf for the purpose of exposition, behaves as an unformatted output function (31.7.6.4) of os. After constructing a sentry object, calls `buf->emit()`. If that call returns `false`, calls `os.setstate(ios_base::badbit)`.  

13 Returns: os.

### 31.7.6.6 Rvalue stream insertion [ostream.rvalue]

```cpp
template<class Ostream, class T>
```
Ostream& operator<<(Ostream& os, const T& x);

Constraints: The expression os << x is well-formed when treated as an unevaluated operand and Ostream is publicly and unambiguously derived from ios_base.

Effects: As if by: os << x;

Returns: std::move(os).

31.7.7 Standard manipulators

The header <iomanip> defines several functions that support extractors and inserters that alter information maintained by class ios_base and its derived classes.

unspected resetiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << resetiosflags(mask) behaves as if it called f(out, mask), or if in is an object of type basic_istream<charT, traits> then the expression in >> resetiosflags(mask) behaves as if it called f(in, mask), where the function f is defined as:

void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}

The expression out << resetiosflags(mask) has type basic_ostream<charT, traits>& and value out. The expression in >> resetiosflags(mask) has type basic_istream<charT, traits>& and value in.

unspected setiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setiosflags(mask) behaves as if it called f(out, mask), or if in is an object of type basic_istream<charT, traits> then the expression in >> setiosflags(mask) behaves as if it called f(in, mask), where the function f is defined as:

void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}

The expression out << setiosflags(mask) has type basic_ostream<charT, traits>& and value out. The expression in >> setiosflags(mask) has type basic_istream<charT, traits>& and value in.

unspected setbase(int base);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setbase(base) behaves as if it called f(out, base), or if in is an object of type basic_istream<charT, traits> then the expression in >> setbase(base) behaves as if it called f(in, base), where the function f is defined as:

void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
                base == 10 ? ios_base::dec :
                base == 16 ? ios_base::hex :
                ios_base::fmtflags(0), ios_base::basefield);
}

The expression out << setbase(base) has type basic_ostream<charT, traits>& and value out. The expression in >> setbase(base) has type basic_istream<charT, traits>& and value in.

301) The expression cin >> resetiosflags(ios_base::skipws) clears ios_base::skipws in the format flags stored in the basic_istream<charT, traits> object cin (the same as cin >> noskipws), and the expression cout << resetiosflags(ios_base::showbase) clears ios_base::showbase in the format flags stored in the basic_ostream<charT, traits> object cout (the same as cout << noshowbase).
unspecified setfill(char_type c);

5  Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> and c has type charT then the expression out << setfill(c) behaves as if it called f(out, c), where the function f is defined as:

    template<class charT, class traits>
    void f(basic_ios<charT, traits>& str, charT c) {
        // set fill character
        str.fill(c);
    }

The expression out << setfill(c) has type basic_ostream<charT, traits>& and value out.

unspecified setprecision(int n);

6  Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setprecision(n) behaves as if it called f(out, n), or if in is an object of type basic_istream<charT, traits> then the expression in >> setprecision(n) behaves as if it called f(in, n), where the function f is defined as:

    void f(ios_base& str, int n) {
        // set precision
        str.precision(n);
    }

The expression out << setprecision(n) has type basic_ostream<charT, traits>& and value out. The expression in >> setprecision(n) has type basic_istream<charT, traits>& and value in.

unspecified setw(int n);

7  Returns: An object of unspecified type such that if out is an instance of basic_ostream<charT, traits> then the expression out << setw(n) behaves as if it called f(out, n), or if in is an object of type basic_istream<charT, traits> then the expression in >> setw(n) behaves as if it called f(in, n), where the function f is defined as:

    void f(ios_base& str, int n) {
        // set width
        str.width(n);
    }

The expression out << setw(n) has type basic_ostream<charT, traits>& and value out. The expression in >> setw(n) has type basic_istream<charT, traits>& and value in.

31.7.8 Extended manipulators [ext.manip]

1  The header <iomanip> defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

    template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);

2  Mandates: The type moneyT is either long double or a specialization of the basic_string template (Clause 23).

3  Effects: The expression in >> get_money(mon, intl) described below behaves as a formatted input function (31.7.5.3.1).

4  Returns: An object of unspecified type such that if in is an object of type basic_istream<charT, traits> then the expression in >> get_money(mon, intl) behaves as if it called f(in, mon, intl), where the function f is defined as:

    template<class charT, class traits, class moneyT>
    void f(basic_istream<charT, traits>& str, moneyT& mon, bool intl) {
        using Iter = istreambuf_iterator<charT, traits>;
        using MoneyGet = money_get<charT, Iter>;
        ios_base::iostate err = ios_base::goodbit;
        const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());
        mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);
    }

§ 31.7.8 1695
if (ios_base::goodbit != err)
    str.setstate(err);
}

The expression in >> get_money(mon, intl) has type basic_istream<charT, traits>& and value in.

template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);

Mandates: The type moneyT is either long double or a specialization of the basic_string template (Clause 23).

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << put_money(mon, intl) behaves as a formatted output function (31.7.6.3.1) that calls f(out, mon, intl), where the function f is defined as:

    template<class charT, class traits, class moneyT>
    void f(basic_ostream<charT, traits>& str, const moneyT& mon, bool intl) {
        using Iter = ostreambuf_iterator<charT, traits>;
        using MoneyPut = money_put<charT, Iter>;
        const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
        const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

        if (end.failed())
            str.setstate(ios_base::badbit);
    }

The expression out << put_money(mon, intl) has type basic_ostream<charT, traits>& and value out.

template<class charT> unspecified get_time(tm* tmb, const charT* fmt);

Preconditions: The argument tmb is a valid pointer to an object of type tm, and [fmt, fmt + char_traits<charT>::length(fmt)) is a valid range.

Returns: An object of unspecified type such that if in is an object of type basic_istream<charT, traits> then the expression in >> get_time(tmb, fmt) behaves as if it called f(in, tmb, fmt), where the function f is defined as:

    template<class charT, class traits>
    void f(basic_istream<charT, traits>& str, tm* tmb, const charT* fmt) {
        using Iter = istreambuf_iterator<charT, traits>;
        using TimeGet = time_get<charT, Iter>;
        ios_base::iostate err = ios_base::goodbit;
        const TimeGet& tg = use_facet<TimeGet>(str.getloc());
        tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb, fmt, fmt + traits::length(fmt));

        if (err != ios_base::goodbit)
            str.setstate(err);
    }

The expression in >> get_time(tmb, fmt) has type basic_istream<charT, traits>& and value in.

template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);

Preconditions: The argument tmb is a valid pointer to an object of type tm, and [fmt, fmt + char_traits<charT>::length(fmt)) is a valid range.

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << put_time(tmb, fmt) behaves as if it called f(out, tmb, fmt), where the function f is defined as:

    template<class charT, class traits>
    void f(basic_ostream<charT, traits>& str, const tm* tmb, const charT* fmt) {
        using Iter = ostreambuf_iterator<charT, traits>;
        using TimePut = time_put<charT, Iter>;
        const TimePut& mp = use_facet<TimePut>(str.getloc());
        const Iter end = mp.put(Iter(str.rdbuf()), tmb, fmt);

        if (end.failed())
            str.setstate(ios_base::badbit);
    }
using TimePut = time_put<charT, Iter>;

const TimePut& tp = use_facet<TimePut>(str.getloc());
const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
fmt, fmt + traits::length(fmt));

if (end.failed())
    str.setstate(ios_base::badbit);
}

The expression out << put_time(tmb, fmt) has type basic_ostream<charT, traits>& and value out.

### 31.7.9 Quoted manipulators

[Note 1: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — end note]

```cpp
template<class charT>
unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\'));
template<class charT, class traits, class Allocator>
unspecified quoted(const basic_string<charT, traits, Allocator>& s,
                   charT delim = charT('"'), charT escape = charT('\'));
template<class charT, class traits>
unspecified quoted(basic_string_view<charT, traits> s,
                   charT delim = charT('"'), charT escape = charT('\'));
```

Returns: An object of unspecified type such that if out is an instance of basic_ostream with member type char_type the same as charT and with member type traits_type, which in the second and third forms is the same as traits, then the expression out << quoted(s, delim, escape) behaves as if it were a formatted output function (31.7.6.3.1) of out. This forms a character sequence seq, initially consisting of the following elements:

1. delim.
2. Each character in s. If the character to be output is equal to escape or delim, as determined by traits_type::eq, first output escape.
3. delim.

Let x be the number of elements initially in seq. Then padding is determined for seq as described in 31.7.6.3.1, seq is inserted as if by calling out.rdbuf()->sputn(seq, n), where n is the larger of out.width() and x, and out.width(0) is called. The expression out << quoted(s, delim, escape) has type basic_ostream<charT, traits>& and value out.

```cpp
template<class charT, class traits, class Allocator>
unspecified quoted(basic_string<charT, traits, Allocator>& s,
                   charT delim = charT('"'), charT escape = charT('\'));
```

Returns: An object of unspecified type such that:

1. If in is an instance of basic_istream with member types char_type and traits_type the same as charT and traits, respectively, then the expression in >> quoted(s, delim, escape) behaves as if it extracts the following characters from in using operator>>(basic_istream<charT, traits>&, charT&), which may throw ios_base::failure (31.5.2.2.1):

   1. If the first character extracted is equal to delim, as determined by traits_type::eq, then:
      1.1. If s.clear() is not called, then:
      1.1.1. Turn off the skipws flag.
      1.1.2. s.clear()
      1.1.3. Until an unescaped delim character is reached or !in, extract characters from in and append them to s, except that if an escape is reached, ignore it and append the next character to s.
      1.1.4. Discard the final delim character.
      1.1.5. Restore the skipws flag to its original value.
### 31.7.10 Print functions

#### [print.fun]

```cpp
template<
    class... Args>
    void print(format_string<Args...> fmt, Args&&... args);
1 Effects: Equivalent to:
    print(stdout, fmt, std::forward<Args>(args)...);

template<class... Args>
    void print(FILE* stream, format_string<Args...> fmt, Args&&... args);
2 Effects: If the ordinary literal encoding (5.3) is UTF-8, equivalent to:
    vprint_unicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));
Elsewise, equivalent to:
    vprint_nonunicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));

template<class... Args>
    void println(format_string<Args...> fmt, Args&&... args);
3 Effects: Equivalent to:
    println(stdout, fmt, std::forward<Args>(args)...);

template<class... Args>
    void println(FILE* stream, format_string<Args...> fmt, Args&&... args);
4 Effects: Equivalent to:
    print(stream, "\n", format(fmt, std::forward<Args>(args)...));
	noexcept: string_view fmt, format_args args;
5 Effects: Equivalent to:
    vprint_unicode(stdout, fmt, args);
	noexcept: FILE* stream, string_view fmt, format_args args;
6 Preconditions: stream is a valid pointer to an output C stream.
    string out = vformat(fmt, args);

If stream refers to a terminal capable of displaying Unicode, writes out to the terminal using
the native Unicode API; if out contains invalid code units, the behavior is undefined and implementations
are encouraged to diagnose it. Otherwise writes out to stream unchanged. If the native Unicode API
is used, the function flushes stream before writing out.

[Note 1: On POSIX and Windows, stream referring to a terminal means that, respectively, isatty(fileno(1
stream)) and GetConsoleMode(_get_osfhandle(_fileno(stream)), ...) return nonzero. — end note]
[Note 2: On Windows, the native Unicode API is WriteConsoleW. — end note]

Throws: Any exception thrown by the call to vformat (22.14.3). system_error if writing to the
terminal or stream fails. May throw bad_alloc.

Recommended practice: If invoking the native Unicode API requires transcoding, implementations
should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard,
Chapter 3.9 U+FFFD Substitution in Conversion.
```
void vprint_nonunicode(string_view fmt, format_args args);

Effects: Equivalent to:

vprint_nonunicode(stdout, fmt, args);

void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);

Preconditions: stream is a valid pointer to an output C stream.

Effects: Writes the result of vformat(fmt, args) to stream.

Throws: Any exception thrown by the call to vformat (22.14.3). system_error if writing to stream fails. May throw bad_alloc.

31.8 String-based streams [string.streams]

31.8.1 Header <sstream> synopsis [sstream.syn]

namespace std {

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf;

    template<class charT, class traits, class Allocator>
    void swap(basic_stringbuf<charT, traits, Allocator>& x,
              basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

    using stringbuf = basic_stringbuf<char>;
    using wstringbuf = basic_stringbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_istringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_istringstream<charT, traits, Allocator>& x,
              basic_istringstream<charT, traits, Allocator>& y);

    using istringstream = basic_istringstream<char>;
    using wistringstream = basic_istringstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_ostringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_ostringstream<charT, traits, Allocator>& x,
              basic_ostringstream<charT, traits, Allocator>& y);

    using ostringstream = basic_ostringstream<char>;
    using wostringstream = basic_ostringstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_stringstream<charT, traits, Allocator>& x,
              basic_stringstream<charT, traits, Allocator>& y);

    using stringstream = basic_stringstream<char>;
    using wstringstream = basic_stringstream<wchar_t>;
}

1 The header <sstream> defines four class templates and eight types that associate stream buffers with objects of class basic_string, as described in 23.4.
31.8.2 Class template basic_stringbuf

31.8.2.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;

        // 31.8.2.2, constructors
        basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
        explicit basic_stringbuf(ios_base::openmode which);
        explicit basic_stringbuf(
            const basic_string<charT, traits, Allocator>& s,
            ios_base::openmode which = ios_base::in | ios_base::out);
        explicit basic_stringbuf(const Allocator& a)
            : basic_stringbuf(ios_base::in | ios_base::out, a) {}
        basic_stringbuf(ios_base::openmode which, const Allocator& a);
        explicit basic_stringbuf(
            basic_string<charT, traits, Allocator>&& s,
            ios_base::openmode which = ios_base::in | ios_base::out);
        template<class SAlloc>
        basic_stringbuf(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which = ios_base::in | ios_base::out, a) {}
        template<class SAlloc>
        basic_stringbuf(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which, const Allocator& a);
        template<class SAlloc>
        explicit basic_stringbuf(
            const basic_string<charT, traits, SAlloc>& s,
            ios_base::openmode which = ios_base::in | ios_base::out);
        template<class T>
        explicit basic_stringbuf(const T& t,
            ios_base::openmode which = ios_base::in | ios_base::out);
        template<class T>
        basic_stringbuf(const T& t, const Allocator& a);
        template<class T>
        basic_stringbuf(const T& t, ios_base::openmode which, const Allocator& a);
        basic_stringbuf(const basic_stringbuf&) = delete;
        basic_stringbuf(basic_stringbuf& rhs);
        basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

        // 31.8.2.3, assignment and swap
        basic_stringbuf& operator=(const basic_stringbuf&) = delete;
        basic_stringbuf& operator=(basic_stringbuf& rhs);
        void swap(basic_stringbuf& rhs) noexcept(see below);

        // 31.8.2.4, getters and setters
        allocator_type get_allocator() const noexcept;
        basic_string<charT, traits, Allocator> str() const &;
        template<class SAlloc>
        basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
        basic_string<charT, traits, Allocator> str() &&;
        basic_string_view<charT, traits> view() const noexcept;
    }
void str(const basic_string<charT, traits, Allocator>& s);

template<class SAlloc>
    void str(const basic_string<charT, traits, SAlloc>& s);

void str(basic_string<charT, traits, Allocator>&& s);

template<class T>
    void str(const T& t);

protected:
    // 31.8.2.5, overridden virtual functions
    int_type underflow() override;
    int_type pbackfail(int_type c = traits::eof()) override;
    int_type overflow (int_type c = traits::eof()) override;
    basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

    pos_type seekoff(off_type off, ios_base::seekdir way,
                     ios_base::openmode which = ios_base::in | ios_base::out) override;

    pos_type seekpos(pos_type sp,
                     ios_base::openmode which = ios_base::in | ios_base::out) override;

private:
    ios_base::openmode mode;
    // exposition only
    basic_string<charT, traits, Allocator> buf;
    // exposition only
    void init_buf_ptrs();
    // exposition only
};

1 The class basic_stringbuf is derived from basic_streambuf to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence can be initialized from, or made available as, an object of class basic_string.

2 For the sake of exposition, the maintained data and internal pointer initialization is presented here as:

   (2.1) ios_base::openmode mode, has in set if the input sequence can be read, and out set if the output sequence can be written.

   (2.2) basic_string<charT, traits, Allocator> buf contains the underlying character sequence.

   (2.3) init_buf_ptrs() sets the base class’ get area (31.6.3.4.2) and put area (31.6.3.4.3) pointers after initializing, moving from, or assigning to buf accordingly.

31.8.2.2 Constructors

    explicit basic_stringbuf(ios_base::openmode which);

1 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), and mode with which. It is implementation-defined whether the sequence pointers (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) are initialized to null pointers.

2 Postconditions: str().empty() is true.

    explicit basic_stringbuf(
        const basic_string<charT, traits, Allocator>& s,
        ios_base::openmode which = ios_base::in | ios_base::out);

3 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with s, then calls init_buf_ptrs().

    basic_stringbuf(ios_base::openmode which, const Allocator &a);

4 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with a, then calls init_buf_ptrs().

5 Postconditions: str().empty() is true.

    explicit basic_stringbuf(
        basic_string<charT, traits, Allocator>&& s,

ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with std::move(s), then calls init_buf_ptrs().

template<class SAlloc>
basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with std::move(s), then calls init_buf_ptrs().

template<class SAlloc>
explicit basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);

Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with {s, a}, then calls init_buf_ptrs().

template<class T>
explicit basic_stringbuf(const T& t, ios_base::openmode which = ios_base::in | ios_base::out);

template<class T>
basic_stringbuf(const T& t, const Allocator& a);

template<class T>
basic_stringbuf(const T& t, ios_base::openmode which, const Allocator& a);

Let which be ios_base::in | ios_base::out for the overload with no parameter which, and a be Allocator() for the overload with no parameter a.

Constraints: is_convertible_v<const T& , basic_string_view<charT, traits>> is true.

Effects: Creates a variable sv as if by basic_string_view<charT, traits> sv = t, then value-initializes the base class, initializes mode with which, and direct-non-list-initializes buf with sv, a, then calls init_buf_ptrs().

basic_stringbuf(basic_stringbuf&& rhs);

basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

Effects: Copy constructs the base class from rhs and initializes mode with rhs.mode. In the first form buf is initialized from std::move(rhs).str(). In the second form buf is initialized from {std::move(rhs).str(), a}. It is implementation-defined whether the sequence pointers in *this (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) obtain the values which rhs had.

Postconditions: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

14 Postconditions: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

14.1 str() == rhs_p.str()
14.2 gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
14.3 egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
14.4 pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
14.5 eptr() - pbase() == rhs_p.eptr() - rhs_p.pbase()
14.6 if (eback()) eback() != rhs_a.eback()
14.7 if (gptr()) gptr() != rhs_a.gptr()
14.8 if (egptr()) egptr() != rhs_a.egptr()
14.9 if (pbase()) pbase() != rhs_a.pbase()
14.10 if (pptr()) pptr() != rhs_a.pptr()
14.11 if (eptr()) epptr() != rhs_a.eptr()
14.12 getloc() == rhs_p.getloc()
14.13 rhs is empty but usable, as if std::move(rhs).str() was called.
31.8.2.3 Assignment and swap

```c++
basic_stringbuf operator=(basic_stringbuf& rhs);
```

**Effects**: After the move assignment *this* has the observable state it would have had if it had been move constructed from rhs (see 31.8.2.2).

**Returns**: *this.

```c++
void swap(basic_stringbuf& rhs) noexcept(see below);
```

**Preconditions**: allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == rhs.get_allocator() is true.

**Effects**: Exchanges the state of *this and rhs.

**Remarks**: The exception specification is equivalent to:

```c++
allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value
```

```c++
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
          basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
```

**Effects**: Equivalent to x.swap(y).

31.8.2.4 Member functions

The member functions getting the underlying character sequence all refer to a high_mark value, where high_mark represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the basic_stringbuf passing a basic_string argument, or by calling one of the str member functions passing a basic_string as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new basic_string).

```c++
void init_buf_ptrs(); // exposition only
```

**Effects**: Initializes the input and output sequences from buf according to mode.

**Postconditions**: (3.1) If ios_base::out is set in mode, pbase() points to buf.front() and epptr() >= pbase() + buf.size() is true;

(3.1.1) in addition, if ios_base::ate is set in mode, pptr() == pbase() + buf.size() is true,

(3.1.2) otherwise pptr() == pbase() is true.

(3.2) If ios_base::in is set in mode, eback() points to buf.front(), and (gptr() == eback() && egptr() == eback() + buf.size()) is true.

**Note 1**: For efficiency reasons, stream buffer operations can violate invariants of buf while it is held encapsulated in the basic_stringbuf, e.g., by writing to characters in the range [buf.data() + buf.size(), buf.data() + buf.capacity()]. All operations retrieving a basic_string from buf ensure that the basic_string invariants hold on the returned value. — end note

```c++
allocator_type get_allocator() const noexcept;
```

**Returns**: buf.get_allocator()

```c++
basic_string<charT, traits, Allocator> str() const &;
```

**Effects**: Equivalent to:

```c++
return basic_string<charT, traits, Allocator>(view(), get_allocator());
```

```c++
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

**Constraints**: SAlloc is a type that qualifies as an allocator (24.2.2.2).

**Effects**: Equivalent to:

```c++
return basic_string<charT, traits, SAlloc>(view(), sa);
```
basic_string<charT, traits, Allocator> str() &&;

Postconditions: The underlying character sequence buf is empty and pbase(), pptr(), epptr(), eback(), gptr(), and egptr() are initialized as if by calling init_buf_ptrs() with an empty buf.

Returns: A basic_string<charT, traits, Allocator> object move constructed from the basic_stringbuf’s underlying character sequence in buf. This can be achieved by first adjusting buf to have the same content as view().

basic_string_view<charT, traits> view() const noexcept;

Let sv be basic_string_view<charT, traits>.

Returns: A sv object referring to the basic_stringbuf’s underlying character sequence in buf:

- If ios_base::out is set in mode, then sv(pbase(), high_mark-pbase()) is returned.
- Otherwise, if ios_base::in is set in mode, then sv(eback(), egptr()-eback()) is returned.
- Otherwise, sv() is returned.

[Note 2: Using the returned sv object after destruction or invalidation of the character sequence underlying *this is undefined behavior, unless sv.empty() is true. — end note]

void str(const basic_string<charT, traits, Allocator>& s);
Effects: Equivalent to:
buf = s;
init_buf_ptrs();

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
Constraints: is_same_v<SAlloc,Allocator> is false.
Effects: Equivalent to:
buf = s;
init_buf_ptrs();

void str(basic_string<charT, traits, Allocator>&& s);
Effects: Equivalent to:
buf = std::move(s);
init_buf_ptrs();

template<class T>
void str(const T& t);
Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.
Effects: Equivalent to:
 basic_string_view<charT, traits> sv = t;
buf = sv;
init_buf_ptrs();

31.8.2.5 Overridden virtual functions

int_type underflow() override;
Returns: If the input sequence has a read position available, returns traits::to_int_type(*gptr()). Otherwise, returns traits::eof(). Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

int_type pbackfail(int_type c = traits::eof()) override;
Effects: Puts back the character designated by c to the input sequence, if possible, in one of three ways:
- If traits::eq_int_type(c, traits::eof()) returns false and if the input sequence has a putback position available, and if traits::eq(to_char_type(c), gptr()[-1]) returns true, assigns gptr() - 1 to gptr().
Returns: c.
If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.

Returns: `c`.

If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

Returns: `traits::not_eof(c)`.

3 Returns: As specified above, or `traits::eof()` to indicate failure.

Remarks: If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```cpp
int_type overflow(int_type c = traits::eof()) override;
```

Effects: Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

- If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.
  Signals success by returning `c`.
- If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.
  Signals success by returning a value other than `traits::eof()`.

Returns: As specified above, or `traits::eof()` to indicate failure.

Remarks: The function can alter the number of write positions available as a result of any call.

The function can make a write position available only if `ios_base::out` is set in `mode`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in `mode`, the function alters the read end pointer `egptr()` to point just past the new write position.

```cpp
pos_type seekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 126.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ios_base::in</code> is set in which</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td><code>ios_base::out</code> is set in which</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>both <code>ios_base::in</code> and <code>ios_base::out</code> are set in which and either <code>way == ios_base::beg</code> or <code>way == ios_base::end</code></td>
<td>positions both the input and the output sequences</td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, the function determines `newoff` as indicated in Table 127. If the sequence’s next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

If `(newoff + off) < 0`, or if `newoff + off` refers to an uninitialized character (31.8.2.4), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

Returns: `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`. 
Table 127: newoff values

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios_base::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios_base::cur</td>
<td>the next pointer minus the beginning pointer (xnext - xbeg).</td>
</tr>
<tr>
<td>way == ios_base::end</td>
<td>the high mark pointer minus the beginning pointer (high_mark - xbeg).</td>
</tr>
</tbody>
</table>

pos_type seekpos(pos_type sp,
    = ios_base::in | ios_base::out) override;
13 Effects: Equivalent to seekoff(off_type(sp), ios_base::beg, which).
14 Returns: sp to indicate success, or pos_type(off_type(-1)) to indicate failure.

basic_streambuf<charT, traits*>* setbuf(charT* s, streamsize n) override;
15 Effects: implementation-defined, except that setbuf(0, 0) has no effect.
16 Returns: this.

31.8.3 Class template basic_istringstream
31.8.3.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>,
            class Allocator = allocator<charT>>

private:
  basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

The class basic_istringstream<charT, traits, Allocator> supports reading objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf<charT, traits, Allocator> object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the stringbuf object.

31.8.3.2 Constructors

explicit basic_istringstream(ios_base::openmode which);

1 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::in) (31.8.2.2).

explicit basic_istringstream(
  const basic_string<charT, traits, Allocator>& s,
  ios_base::openmode which = ios_base::in);

2 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).

basic_istringstream(ios_base::openmode which, const Allocator& a);

3 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a) (31.8.2.2).

explicit basic_istringstream(
  basic_string<charT, traits, Allocator>&& s,
  ios_base::openmode which = ios_base::in);

4 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in) (31.8.2.2).
template<class SAlloc>
basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a) (31.8.2.2).

template<class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);

Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).

template<class T>
explicit basic_istringstream(const T& t, ios_base::openmode which = ios_base::in);
template<class T>
basic_istringstream(const T& t, const Allocator& a);
template<class T>
basic_istringstream(const T& t, ios_base::openmode which, const Allocator& a);

Let which be ios_base::in for the overload with no parameter which, and a be Allocator() for the overload with no parameter a.

Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.

Effects: Initializes the base class with addressof(sb), and direct-non-list-initializes sb with t, which | ios_base::in, a.

basic_istringstream(basic_istringstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_stringbuf.

31.8.3.3 Swap [istringstream.swap]

void swap(basic_istringstream& rhs);

Effects: Equivalent to:
    basic_istream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
    basic_istringstream<charT, traits, Allocator>& y);

Effects: Equivalent to x.swap(y).

31.8.3.4 Member functions [istringstream.members]

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

Returns: const_cast<basic_stringbuf<charT, traits, Allocator>* >(addressof(sb)).

basic_string<charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;

Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT,traits,Allocator> str() &&;

Effects: Equivalent to: return std::move(*rdbuf()).str();
basic_string_view<CharT, Traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<CharT, Traits, Alloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<CharT, Traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<CharT, Traits, Alloc>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

template<class T>
void str(const T& t);

Effects: Equivalent to: rdbuf()->str(t);

Constraints: is_convertible_v<const T&, basic_string_view<CharT, Traits>> is true.

31.8.4 Class template basic_ostringstream

31.8.4.1 General

namespace std {

    template<class CharT, class Traits = char_traits<CharT>,
             class Allocator = allocator<CharT>>
    class basic_ostringstream : public basic_ostream<CharT, Traits> {

public:
    using char_type = CharT;
    using int_type = typename Traits::int_type;
    using pos_type = typename Traits::pos_type;
    using off_type = typename Traits::off_type;
    using traits_type = Traits;
    using allocator_type = Allocator;

    // 31.8.4.2, constructors
    basic_ostringstream() : basic_ostringstream(ios_base::out) {} // [ostringstream]
    explicit basic_ostringstream(ios_base::openmode which);
    explicit basic_ostringstream(
        const basic_string<CharT, Traits, Allocator>& s,
        ios_base::openmode which = ios_base::out);
    basic_ostringstream(ios_base::openmode which, const Allocator& a);
    explicit basic_ostringstream(
        const basic_string<CharT, Traits, SAlloc>& s,
        ios_base::openmode which = ios_base::out, const Allocator& a);
    template<class SAlloc>
    basic_ostringstream(
        const basic_string<CharT, Traits, SAlloc>& s, const Allocator& a)
    : basic_ostringstream(s, ios_base::out, a) {} // [ostringstream.general]
    template<class SAlloc>
    basic_ostringstream(
        const basic_string<CharT, Traits, SAlloc>& s, ios_base::openmode which, const Allocator& a);
    template<class T>
    explicit basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
    template<class T>
    basic_ostringstream(const T& t, const Allocator& a);
    template<class T>
    basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);
    basic_ostringstream(const basic_ostringstream&) = delete;

§ 31.8.4.1
basic_ostreamstream(basic_ostreamstream&& rhs);

basic_ostreamstream& operator=(const basic_ostreamstream&) = delete;
basic_ostreamstream& operator=(basic_ostreamstream&& rhs);

// 31.8.4.3, swap
void swap(basic_ostreamstream& rhs);

// 31.8.4.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
    basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;
void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>

void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
    void str(const T& t);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

The class basic_ostreamstream supports writing objects of class basic_string. It uses a basic_stringbuf object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the stringbuf object.

31.8.4.2 Constructors

explicit basic_ostreamstream(ios_base::openmode which);

1 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::out) (31.8.2.2).

effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

3 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

explicit basic_ostreamstream(basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out);

4 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out) (31.8.2.2).

template<class SAlloc>
    basic_ostreamstream(charT, traits, SAlloc>& s,
ios_base::openmode which, const Allocator& a);

Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a) (31.8.2.2).

template<class SAlloc>
extensible basic_ostringstream(
  const basic_string<charT, traits, SAlloc>& s,
  ios_base::openmode which = ios_base::out);

Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

template<class T>
extensible basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
template<class T>
extensible basic_ostringstream(const T& t, const Allocator& a);
template<class T>
extensible basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);

Let which be ios_base::out for the overload with no parameter which, and a be Allocator() for the overload with no parameter a.

Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.

Effects: Initializes the base class with addressof(sb), and direct-non-list-initializes sb with t, which | ios_base::out, a.

basic_ostringstream(basic_ostringstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Then calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_stringbuf.

31.8.4.3 Swap [ostringstream.swap]

void swap(basic_ostringstream& rhs);

Effects: Equivalent to:

basic_ostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
basic_ostringstream<charT, traits, Allocator>& y);

Effects: Equivalent to x.swap(y).

31.8.4.4 Member functions [ostringstream.members]

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

basic_string<charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;

Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT,traits,Allocator> str() &&;

Effects: Equivalent to: return std::move(*rdbuf()).str();
basic_string_view<CharT, Traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<CharT, Traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
  void str(const basic_string<CharT, Traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<CharT, Traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

template<class T>
  void str(const T& t);

Constraints: is_convertible_v<const T&, basic_string_view<CharT, Traits>> is true.

Effects: Equivalent to: rdbuf()->str(t);

31.8.5 Class template basic_stringstream

31.8.5.1 General

namespace std {
  template<class CharT, class Traits = char_traits<CharT>,
           class Allocator = allocator<CharT>>
  class basic_stringstream : public basic_iostream<CharT, Traits> {
    public:
      using char_type = CharT;
      using int_type = typename Traits::int_type;
      using pos_type = typename Traits::pos_type;
      using off_type = typename Traits::off_type;
      using traits_type = Traits;
      using allocator_type = Allocator;

    // 31.8.5.2, constructors
    basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {};
    explicit basic_stringstream(ios_base::openmode which);
    explicit basic_stringstream(
      const basic_string<CharT, Traits, Allocator>&& s,
      ios_base::openmode which = ios_base::out | ios_base::in);
    basic_stringstream(ios_base::openmode which, const Allocator& a);
    explicit basic_stringstream(
      basic_string<CharT, Traits, Allocator>&& s,
      ios_base::openmode which = ios_base::out | ios_base::in);
    template<class SAlloc>
      basic_stringstream(
        const basic_string<CharT, Traits, SAlloc>&& s, const Allocator& a)
      : basic_stringstream(s, ios_base::out | ios_base::in, a) {};
    template<class SAlloc>
      basic_stringstream(
        const basic_string<CharT, Traits, SAlloc>&& s,
        ios_base::openmode which, const Allocator& a);
    template<class SAlloc>
      explicit basic_stringstream(
        const basic_string<CharT, Traits, SAlloc>&& s,
        ios_base::openmode which = ios_base::out | ios_base::in);
    template<class T>
      explicit basic_stringstream(const T& t,
                              ios_base::openmode which = ios_base::out | ios_base::in);
    template<class T>
      basic_stringstream(const T& t, const Allocator& a);
    template<class T>
      basic_stringstream(const T& t, ios_base::openmode which, const Allocator& a);
  };
}
The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

— `sb`, the `stringbuf` object.

### 31.8.5.2 Constructors

**explicit basic_stringstream(ios_base::openmode which);**

1. *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

**explicit basic_stringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);**

2. *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)`.

**basic_stringstream(ios_base::openmode which, const Allocator& a);**

3. *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_stringbuf<charT, traits, Allocator>(which, a)`.

**explicit basic_stringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out | ios_base::in);**

4. *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which)`.
ios_base::openmode which, const Allocator& a);

Effects: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` (31.8.2.2).

```cpp
template<class SAlloc>
explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

Constraints: `is_same_v<SAlloc,Allocator>` is false.

Effects: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)` (31.8.2.2).

```cpp
template<class T>
explicit basic_stringstream(const T& t, ios_base::openmode which = ios_base::out | ios_base::in);
```

```cpp
template<class T>
basic_stringstream(const T& t, const Allocator& a);
```

Let `which` be `ios_base::out | ios_base::in` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

Constraints: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

Effects: Initializes the base class with `addressof(sb)`, and direct-non-list-initializes `sb` with `t`, `which`, `a`.

```cpp
basic_stringstream(basic_stringstream&& rhs);
```

Effects: Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

§ 31.8.5.3 Swap

```cpp
void swap(basic_stringstream& rhs);
```

Effects: Equivalent to:

```cpp
basic_iostream<charT,traits>::swap(rhs);
sb.swap(rhs.sb);
```

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
    basic_stringstream<charT, traits, Allocator>& y);
```

Effects: Equivalent to `x.swap(y)`.

§ 31.8.5.4 Member functions

```cpp
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

Returns: `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```cpp
basic_string<charT, traits, Allocator> str() const &;
```

Effects: Equivalent to: `return rdbuf()->str();`

```cpp
template<class SAlloc>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
```

Effects: Equivalent to: `return rdbuf()->str(sa);`

```cpp
basic_string<charT,traits,Allocator> str() &&;
```

Effects: Equivalent to: `return std::move(*rdbuf()).str();`

```cpp
basic_string_view<charT, traits> view() const noexcept;
```

Effects: Equivalent to: `return rdbuf()->view();`
void str(const basic_string<charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

Effects: Equivalent to: rdbuf()->str(s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

31.9 Span-based streams

31.9.1 Overview

The header `<spanstream>` defines class templates and types that associate stream buffers with objects whose types are specializations of `span` as described in 24.7.2.2.

[Note 1: A user of these classes is responsible for ensuring that the character sequence represented by the given `span` outlives the use of the sequence by objects of the classes in subclause 31.9. Using multiple `basic_spanbuf` objects referring to overlapping underlying sequences from different threads, where at least one `basic_spanbuf` object is used for writing to the sequence, results in a data race. —end note]

31.9.2 Header `<spanstream>` synopsis

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf;

    template<class charT, class traits>
    void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

    using spanbuf = basic_spanbuf<char>;
    using wspanbuf = basic_spanbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream;

    template<class charT, class traits>
    void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

    using ispanstream = basic_ispanstream<char>;
    using wispanstream = basic_ispanstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream;

    template<class charT, class traits>
    void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

    using ospanstream = basic_ospanstream<char>;
    using wospanstream = basic_ospanstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_spanstream;

    template<class charT, class traits>
    void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

    using spanstream = basic_spanstream<char>;
    using wspanstream = basic_spanstream<wchar_t>;

§ 31.9.2 1715
using spanstream = basic_spanstream<char>;
using wspanstream = basic_spanstream<wchar_t>;
}

31.9.3 Class template basic_spanbuf

31.9.3.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.9.3.2, constructors
            basic_spanbuf() : basic_spanbuf(ios_base::in | ios_base::out) {}
            explicit basic_spanbuf(ios_base::openmode which)
                : basic_spanbuf(std::span<charT>(), which) {}
            explicit basic_spanbuf(std::span<charT> s,
                ios_base::openmode which = ios_base::in | ios_base::out);
            basic_spanbuf(const basic_spanbuf&) = delete;
            basic_spanbuf(basic_spanbuf&& rhs);

            // 31.9.3.3, assignment and swap
            basic_spanbuf& operator=(const basic_spanbuf&) = delete;
            basic_spanbuf& operator=(basic_spanbuf&& rhs);
            void swap(basic_spanbuf& rhs);

            // 31.9.3.4, member functions
            std::span<charT> span() const noexcept;
            void span(std::span<charT> s) noexcept;

        protected:
            // 31.9.3.5, overridden virtual functions
            basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
            pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which = ios_base::in | ios_base::out) override;
            pos_type seekpos(pos_type sp,
                ios_base::openmode which = ios_base::in | ios_base::out) override;

        private:
            ios_base::openmode mode;                        // exposition only
            std::span<charT> buf;                           // exposition only
    };
}

1 The class template basic_spanbuf is derived from basic_streambuf to associate possibly the input sequence
and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an
object of class span<charT>.

2 For the sake of exposition, the maintained data is presented here as:

(2.1) — ios_base::openmode mode, has in set if the input sequence can be read, and out set if the output
sequence can be written.

(2.2) — std::span<charT> buf is the view to the underlying character sequence.

31.9.3.2 Constructors

explicit basic_spanbuf(std::span<charT> s,
**ios_base::openmode which = ios_base::in | ios_base::out;**

**Effects:** Initializes the base class with `basic_streambuf()` (31.6.3.2), and `mode` with which. Initializes the internal pointers as if calling `span(s)`.

`basic_spanbuf(basic_spanbuf&& rhs);`

**Effects:** Initializes the base class with `std::move(rhs)` and `mode` with `std::move(rhs.mode)` and `buf` with `std::move(rhs.buf)`. The sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. It is implementation-defined whether `rhs.buf.empty()` returns `true` after the move.

**Postconditions:** Let `rhs_p` refer to the state of `rhs` just prior to this construction.

3.1.9.3.3 Assignment and swap

`basic_spanbuf& operator=(basic_spanbuf&& rhs);`

**Effects:** Equivalent to:

```cpp
basic_spanbuf tmp{std::move(rhs)};
this->swap(tmp);
return *this;
```

`void swap(basic_spanbuf& rhs);`

**Effects:** Equivalent to:

```cpp
basic_streambuf<charT, traits>::swap(rhs);
std::swap(mode, rhs.mode);
std::swap(buf, rhs.buf);
```

**template<class charT, class traits> void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);**

**Effects:** Equivalent to `x.swap(y).

3.1.9.3.4 Member functions

`std::span<charT> span() const noexcept;`

**Returns:** If `ios_base::out` is set in `mode`, returns `std::span<charT>(pbase(), pptr())`, otherwise returns `buf`.

[Note 1: In contrast to `basic_stringbuf`, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to `basic_string<charT>`. — end note]

`void span(std::span<charT> s) noexcept;`

**Effects:** `buf = s`. Initializes the input and output sequences according to `mode`.

**Postconditions:**

3.1.1.1 — If `ios_base::out` is set in `mode`, `pbase() == s.data() && epptr() == pbase() + s.size()` is `true`;

3.1.1.2 — in addition, if `ios_base::ate` is set in `mode`, `pptr() == pbase() + s.size()` is `true`;

3.1.2 — otherwise `pptr() == pbase()` is `true`. 

§ 31.9.3.4
If `ios_base::in` is set in `mode`, `eback() == s.data() && gptr() == eback() && egptr() == eback() + s.size()` is true.

### 31.9.3.5 Overridden virtual functions

- **Note 1**: Because the underlying buffer is of fixed size, neither `overflow`, `underflow`, nor `pbackfail` can provide useful behavior. — end note

```cpp
pos_type seekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects**: Alters the stream position within one or both of the controlled sequences, if possible, as follows:

- If `ios_base::in` is set in `which`, positions the input sequence; `xnext` is `gptr()`, `xbeg` is `eback()`.
- If `ios_base::out` is set in `which`, positions the output sequence; `xnext` is `pptr()`, `xbeg` is `pbase()`.
- If both `ios_base::in` and `ios_base::out` are set in `which` and `way` is `ios_base::cur`, the positioning operation fails.

For a sequence to be positioned, if its next pointer `xnext` (either `gptr()` or `pptr()`) is a null pointer and the new offset `newoff` as computed below is nonzero, the positioning operation fails. Otherwise, the function determines `baseoff` as a value of type `off_type` as follows:

- 0 when `way` is `ios_base::beg`;
- `(pptr() - pbase())` for the output sequence, or `(gptr() - eback())` for the input sequence when `way` is `ios_base::cur`;
- when `way` is `ios_base::end`:
  - `(pptr() - pbase())` if `ios_base::out` is set in `mode` and `ios_base::in` is not set in `mode`,
  - `buf.size()` otherwise.

If `baseoff + off` would overflow, or if `baseoff + off` is less than zero, or if `baseoff + off` is greater than `buf.size()`, the positioning operation fails. Otherwise, the function computes

```cpp
off_type newoff = baseoff + off;
```

and assigns `xbeg + newoff` to the next pointer `xnext`.

**Returns**: `pos_type(off_type(-1))` if the positioning operation fails; `pos_type(newoff)` otherwise.

```cpp
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects**: Equivalent to:

```cpp
return seekoff(off_type(sp), ios_base::beg, which);
```

```cpp
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

**Effects**: Equivalent to:

```cpp
this->span(std::span<charT>(s, n));
return this;
```

### 31.9.4 Class template `basic_ispanstream`

#### [ispanstream]
#### [ispanstream.general]

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream : public basic_istream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.9.4.2, constructors
            explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);
    }
}
```
31.9.4.2 Constructors [ispanstream.cons]

explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) and sb with basic_spanbuf<charT, traits>(s, which | ios_base::in) (31.9.3.2).

basic_ispanstream(basic_ispanstream&& rhs);

Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next, basic_istream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_spanbuf.

template<class ROS> explicit basic_ispanstream(ROS&& s)

Constraints: ROS models ranges::borrowed_range. !convertible_to<ROS, std::span<charT>> & convertible_to<ROS, std::span<charT const>> is true.

Effects: Let sp be std::span<const charT>(std::forward<ROS>(s)). Equivalent to:

    basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))

31.9.4.3 Swap [ispanstream.swap]

void swap(basic_ispanstream& rhs);

Effects: Equivalent to:

    basic_istream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits>

    void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

Effects: Equivalent to x.swap(y).

31.9.4.4 Member functions [ispanstream.members]

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

Effects: Equivalent to:

    return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

std::span<const charT> span() const noexcept;

Effects: Equivalent to: return rdbuf()->span();
void span(std::span<charT> s) noexcept;

Effects: Equivalent to rdbuf() -> span(s).

template<class ROS> void span(ROS&& s) noexcept;

Constraints: ROS models ranges::borrowed_range. (!convertible_to<ROS, std::span<charT>> && convertible_to<ROS, std::span<const charT>> is true.

Effects: Let sp be std::span<const charT>(std::forward<ROS>(s)). Equivalent to:
  this->span(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()));

31.9.5 Class template basic_ospanstream  
[ospanstream]
31.9.5.1 General  
[ospanstream.general]

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream
    : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.9.5.2, constructors
            explicit basic_ospanstream(std::span<charT> s,
                ios_base::openmode which = ios_base::out);
            // 31.9.5.3, swap
            void swap(basic_ospanstream& rhs);
            // 31.9.5.4, member functions
            basic_spanbuf<charT, traits>* rdbuf() const noexcept;
            std::span<charT> span() const noexcept;
            void span(std::span<charT> s) noexcept;

        private:
            basic_spanbuf<charT, traits> sb; // exposition only
    };
}

31.9.5.2 Constructors  
[ospanstream.cons]

explicit basic_ospanstream(std::span<charT> s,
    ios_base::openmode which = ios_base::out);

Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) and sb with basic_spanbuf<charT, traits>(s, which | ios_base::out) (31.9.3.2).

basic_ospanstream(basic_ospanstream&& rhs) noexcept;

Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next, basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_spanbuf.

31.9.5.3 Swap  
[ospanstream.swap]

void swap(basic_ospanstream& rhs);

Effects: Equivalent to:
basic_ostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);

template<class charT, class traits>
void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

Effects: Equivalent to x.swap(y).

31.9.5.4 Member functions

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

Effects: Equivalent to:
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

std::span<charT> span() const noexcept;

Effects: Equivalent to: return rdbuf()->span();

void span(std::span<charT> s) noexcept;

Effects: Equivalent to rdbuf()->span(s).

31.9.6 Class template basic_spanstream

31.9.6.1 General

namespace std {
template<class charT, class traits = char_traits<charT>>
class basic_spanstream : public basic_iostream<charT, traits> {
public:
  using char_type = charT;
  using int_type = typename traits::int_type;
  using pos_type = typename traits::pos_type;
  using off_type = typename traits::off_type;
  using traits_type = traits;

  // 31.9.6.2, constructors
  explicit basic_spanstream(std::span<charT> s,
                             ios_base::openmode which = ios_base::out | ios_base::in);
  basic_spanstream(const basic_spanstream&) = delete;
  basic_spanstream(basic_spanstream&& rhs);
  basic_spanstream& operator=(const basic_spanstream&) = delete;
  basic_spanstream& operator=(basic_spanstream&& rhs);

  // 31.9.6.3, swap
  void swap(basic_spanstream& rhs);

  // 31.9.6.4, members
  basic_spanbuf<charT, traits>* rdbuf() const noexcept;

  std::span<charT> span() const noexcept;
  void span(std::span<charT> s) noexcept;

private:
  basic_spanbuf<charT, traits> sb; // exposition only
};
}

31.9.6.2 Constructors

explicit basic_spanstream(std::span<charT> s,
                           ios_base::openmode which = ios_base::out | ios_base::in);

Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) and sb
with basic_spanbuf<charT, traits>(s, which) (31.9.3.2).
basic_spanstream(basic_spanstream&& rhs);

Effects: Initializes the base class with \texttt{std::move(rhs)} and \texttt{sb} with \texttt{std::move(rhs.sb)}. Next, \texttt{basic_iostream<charT, traits>::set_rdbuf(addressof(sb))} is called to install the contained basic_spanbuf.

### 31.9.6.3 Swap

[spanstream.swap]

```cpp
void swap(basic_spanstream& rhs);
```

Effects: Equivalent to:

- \texttt{basic_iostream<charT, traits>::swap(rhs)};
- \texttt{sb.swap(rhs.sb)};

```cpp
template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);
```

Effects: Equivalent to \texttt{x.swap(y)}.

### 31.9.6.4 Member functions

[spanstream.members]

```cpp
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

Effects: Equivalent to:

```cpp
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

- \texttt{std::span<charT> span()} const noexcept;
- Returns the span of the basic_spanbuf.

```cpp
void span(std::span<charT> s) noexcept;
```

Effects: Equivalent to \texttt{rdbuf()->span(s)}.

### 31.10 File-based streams

[file.streams]

#### 31.10.1 Header \texttt{<fstream> synopsis}

[fstream.syn]

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf;

    template<class charT, class traits>
    void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

    using filebuf = basic_filebuf<char>;
    using wfilebuf = basic_filebuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream;

    template<class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

    using ifstream = basic_ifstream<char>;
    using wifstream = basic_ifstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream;

    template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);

    using ofstream = basic_ofstream<char>;
    using wofstream = basic_ofstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_fstream;
```
The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

[Note 1: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. —end note]

In subclause 31.10, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type` is not `char`.

[Note 2: These functions enable class path support for systems with a wide native path character type, such as `wchar_t`. —end note]

### 31.10.2 Native handles

Several classes described in 31.10 have a member `native_handle_type`.

The type `native_handle_type` represents a platform-specific native handle to a file. It is trivially copyable and models `semiregular`.

[Note 1: For operating systems based on POSIX, `native_handle_type` is `int`. For Windows-based operating systems, `native_handle_type` is `HANDLE`. —end note]

### 31.10.3 Class template basic_filebuf

#### 31.10.3.1 General

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using native_handle_type = implementation-defined;  // see 31.10.2

        // 31.10.3.2, constructors/destructor
            basic_filebuf();
            basic_filebuf(const basic_filebuf&) = delete;
            basic_filebuf(basic_filebuf&& rhs);
            virtual ~basic_filebuf();

        // 31.10.3.3, assignment and swap
            basic_filebuf& operator=(const basic_filebuf&) = delete;
            basic_filebuf& operator=(basic_filebuf&& rhs);
            void swap(basic_filebuf& rhs);

        // 31.10.3.4, members
            bool is_open() const;
            basic_filebuf* open(const char* s, ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path::value_type* s, ios_base::openmode mode);  // wide systems only; see 31.10.1
            basic_filebuf* open(const string& s, ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
            basic_filebuf* close();
            native_handle_type native_handle() const noexcept;
    }
}
```

protected:

// 31.10.3.5, overridden virtual functions

`streamsize showmanyc()` override;
int_type underflow() override;
int_type uflow() override;
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;
basic_streambuf<charT, traits>* setbuf(char_type* s, streamsize n) override;
pos_type seekoff(off_type off, ios_base::seekdir way,
in ios_base::openmode which = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp,
in ios_base::openmode which = ios_base::in | ios_base::out) override;
int sync() override;
void imbue(const locale& loc) override;
};

The class basic_filebuf<charT, traits> associates both the input sequence and the output sequence with a file.

The restrictions on reading and writing a sequence controlled by an object of class basic_filebuf<charT, traits> are the same as for reading and writing with the C standard library FILEs.

In particular:

(3.1) — If the file is not open for reading the input sequence cannot be read.
(3.2) — If the file is not open for writing the output sequence cannot be written.
(3.3) — A joint file position is maintained for both the input sequence and the output sequence.

An instance of basic_filebuf behaves as described in 31.10.3 provided traits::pos_type is fpos<traits::state_type>. Otherwise the behavior is undefined.

The file associated with a basic_filebuf has an associated value of type native_handle_type, called the native handle (31.10.2) of that file. This native handle can be obtained by calling the member function native_handle.

For any opened basic_filebuf f, the native handle returned by f.native_handle() is invalidated when f.close() is called, or f is destroyed.

In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as a_codecvt in following subclauses, obtained as if by

const codecvt<charT, char, typename traits::state_type>& a_codecvt =
use_facet< codecvt<charT, char, typename traits::state_type>> (getloc());

31.10.3.2 Constructors

basic_filebuf();

Effects: Initializes the base class with basic_streambuf<charT, traits>() (31.6.3.2).
Postconditions: is_open() == false.

basic_filebuf(basic_filebuf&& rhs);

Effects: It is implementation-defined whether the sequence pointers in *this (eback(), gptr(),
egptrt(), pbase(), ppotr(), eptrt()) obtain the values which rhs had. Whether they do or not, *this and rhs reference separate buffers (if any at all) after the construction. Additionally *this references the file which rhs did before the construction, and rhs references no file after the construction. The openmode, locale and any other state of rhs is also copied.

Postconditions: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

(4.1) — is_open() == rhs_p.is_open()
(4.2) — rhs_a.is_open() == false
(4.3) — gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
(4.4) — egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
(4.5) \[ \text{pptr() - pbase() == rhs.p.pptr() - rhs.p.pbase()} \]
(4.6) \[ \text{eptr() - pbase() == rhs.p.eptr() - rhs.p.pbase()} \]
(4.7) \[ \text{if (eback()) eback() != rhs.a.eback()} \]
(4.8) \[ \text{if (gptr()) gptr() != rhs.a.gptr()} \]
(4.9) \[ \text{if (egptr()) egptr() != rhs.a.egptr()} \]
(4.10) \[ \text{if (pbase()) pbase() != rhs.a.pbase()} \]
(4.11) \[ \text{if (pptr()) pptr() != rhs.a.pptr()} \]
(4.12) \[ \text{if (epptr()) epptr() != rhs.a.epptr()} \]

virtual ~basic_filebuf();

Effects: Calls close(). If an exception occurs during the destruction of the object, including the call to close(), the exception is caught but not rethrown (see 16.4.6.13).

31.10.3.3 Assignment and swap

basic_filebuf& operator=(basic_filebuf&& rhs);

Effects: Calls close() then move assigns from rhs. After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 31.10.3.2).

Returns: *this.

void swap(basic_filebuf& rhs);

Effects: Exchanges the state of *this and rhs.

template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

Effects: Equivalent to x.swap(y).

31.10.3.4 Member functions

bool is_open() const;

Returns: true if a previous call to open succeeded (returned a non-null value) and there has been no intervening call to close.

basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s, ios_base::openmode mode); // wide systems only; see 31.10.1

Preconditions: s points to a NTCTS (3.36).

Effects: If is_open() != false, returns a null pointer. Otherwise, initializes the filebuf as required. It then opens the file to which s resolves, if possible, as if by a call to fopen with the second argument determined from mode & ~ios_base::ate as indicated in Table 128. If mode is not some combination of flags shown in the table then the open fails.

If the open operation succeeds and ios_base::ate is set in mode, positions the file to the end (as if by calling fseek(file, 0, SEEK_END), where file is the pointer returned by calling fopen).

If the repositioning operation fails, calls close() and returns a null pointer to indicate failure.

Returns: this if successful, a null pointer otherwise.

basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);

Returns: open(s.c_str(), mode);

basic_filebuf* close();

Effects: If is_open() == false, returns a null pointer. If a put area exists, calls overflow(traits::eof()) to flush characters. If the last virtual member function called on *this (between underflow,
overflow, seekoff, and seekpos) was overflow then calls a_codecvt.unshift (possibly several times) to determine a termination sequence, inserts those characters and calls overflow(traits::eof()) again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling fclose(file)). If any of the calls made by the function, including fclose, fails, close fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

Postconditions: is_open() == false.

Returns: this on success, a null pointer otherwise.

native_handle_type native_handle() const noexcept;

Preconditions: is_open() is true.

Returns: The native handle associated with *this.

31.10.3.5 Overridden virtual functions

streamsize showmanyc() override;

Effects: Behaves the same as basic_streambuf::showmanyc() (31.6.3.5).

Remarks: An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

int_type underflow() override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::underflow(), with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (extern_buf) and then as if by doing:

```c++
char extern_buf[XSIZE];
char* extern_end;
```
charT intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r =
a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
        intern_buf, intern_buf+ISIZE, intern_end);

This shall be done in such a way that the class can recover the position (fpos_t) corresponding to each character between intern_buf and intern_end. If the value of \texttt{r} indicates that \texttt{a_codecvt.in()} ran out of space in intern_buf, retry with a larger intern_buf.

\textbf{int_type uflow() override;}

\textit{Effects:} Behaves according to the description of basic_streambuf<charT, traits>::uflow(), with the specialization that a sequence of characters is read from the input with the same method as used by \texttt{underflow}.

\textbf{int_type pbackfail(int_type c = traits::eof()) override;}

\textit{Effects:} Puts back the character designated by \texttt{c} to the input sequence, if possible, in one of three ways:

(5.1) \textit{If traits::eq_int_type(c, traits::eof()) returns false and if the function makes a putback position available and if traits::eq(to_char_type(c), gptr()[\texttt{-1}]) returns true, decrements the next pointer for the input sequence, gptr().}

Returns: \texttt{c}.

(5.2) \textit{If traits::eq_int_type(c, traits::eof()) returns false and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores \texttt{c} there.}

Returns: \texttt{c}.

(5.3) \textit{If traits::eq_int_type(c, traits::eof()) returns true, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, gptr().}

Returns: traits::not_eof(c).

6 \textit{Returns:} As specified above, or \texttt{traits::eof()} to indicate failure.

7 \textit{Remarks:} If \texttt{is_open() == false}, the function always fails.

8 The function does not put back a character directly to the input sequence.

9 If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

\textbf{int_type overflow(int_type c = traits::eof()) override;}

\textit{Effects:} Behaves according to the description of basic_streambuf<charT, traits>::overflow(c), except that the behavior of “consuming characters” is performed by first converting as if by:

\begin{verbatim}
    charT* b = pbase();
    charT* p = pptr();
    charT* end;
    char xbuf[XSIZE];
    char* xbuf_end;
    codecvt_base::result r =
        a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
\end{verbatim}

and then

(10.1) \textit{If \texttt{r} == codecvt_base::error then fail.}

(10.2) \textit{If \texttt{r} == codecvt_base::noconv then output characters from b up to (and not including) p.}

(10.3) \textit{If \texttt{r} == codecvt_base::partial then output to the file characters from xbuf up to xbuf_end, and repeat using characters from end to p. If output fails, fail (without repeating).}

(10.4) \textit{Otherwise output from xbuf to xbuf_end, and fail if output fails. At this point if b != p and b == end (xbuf isn’t large enough) then increase XSIZE and repeat from the beginning.}

\textit{Returns:} traits::not_eof(c) to indicate success, and \texttt{traits::eof()} to indicate failure. If \texttt{is_open() == false}, the function always fails.
basic_streambuf* setbuf(char_type* s, streamsize n) override;

Effects: If setbuf(0, 0) is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that pbase() and pptr() always return null and output to the file should appear as soon as possible.

pos_type seekoff(off_type off, ios_base::seekdir way, 
    ios_base::openmode which
 = ios_base::in | ios_base::out) override;

Effects: Let width denote a_codecvt.encoding(). If is_open() == false, or off != 0 & & width <= 0, then the positioning operation fails. Otherwise, if way != basic_ios::cur or off != 0, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if width > 0, call fseek(file, width * off, whence), otherwise call fseek(file, 0, whence).

Returns: A newly constructed pos_type object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns pos_type(off_type(-1)).

Remarks: “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if width is less than zero then call a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end) and output the resulting unshift sequence. The function determines one of three values for the argument whence, of type int, as indicated in Table 129.

<table>
<thead>
<tr>
<th>way</th>
<th>Value</th>
<th>stdio Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_ios::beg</td>
<td>SEEK_SET</td>
<td></td>
</tr>
<tr>
<td>basic_ios::cur</td>
<td>SEEK_CUR</td>
<td></td>
</tr>
<tr>
<td>basic_ios::end</td>
<td>SEEK_END</td>
<td></td>
</tr>
</tbody>
</table>

pos_type seekpos(pos_type sp, 
    ios_base::openmode which
 = ios_base::in | ios_base::out) override;

Alters the file position, if possible, to correspond to the position stored in sp (as described below). Altering the file position performs as follows:

1. if (om & ios_base::out) != 0, then update the output sequence and write any unshift sequence;
2. set the file position to sp as if by a call to fsetpos;
3. if (om & ios_base::in) != 0, then update the input sequence;

where om is the open mode passed to the last call to open(). The operation fails if is_open() returns false.

If sp is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If sp has not been obtained by a previous successful call to one of the positioning functions (seekoff or seekpos) on the same file the effects are undefined.

Returns: sp on success. Otherwise returns pos_type(off_type(-1)).

int sync() override;

Effects: If a put area exists, calls filebuf::overflow to write the characters to the file, then flushes the file as if by calling fflush(file). If a get area exists, the effect is implementation-defined.

void imbue(const locale& loc) override;

Preconditions: If the file is not positioned at its beginning and the encoding of the current locale as determined by a_codecvt.encoding() is state-dependent (30.4.2.5.3) then that facet is the same as the corresponding facet of loc.

Effects: Causes characters inserted or extracted after this call to be converted according to loc until another call of imbue.
Remarks: This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

31.10.4 Class template basic_ifstream
31.10.4.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream : public basic_istream<charT, traits> {
public:
    using char_type = charT;
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;
    using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

    basic_ifstream();
    explicit basic_ifstream(const char* s,
        ios_base::openmode mode = ios_base::in);
    explicit basic_ifstream(const filesystem::path::value_type* s,
        ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
    explicit basic_ifstream(const string& s,
        ios_base::openmode mode = ios_base::in);
    template<class T>
        explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
    basic_ifstream(const basic_ifstream&) = delete;
    basic_ifstream(basic_ifstream&& rhs);
    basic_ifstream& operator=(const basic_ifstream&) = delete;
    basic_ifstream& operator=(basic_ifstream&& rhs);

    void swap(basic_ifstream& rhs);

    basic_filebuf<charT, traits>* rdbuf() const;
    native_handle_type native_handle() const noexcept;
    bool is_open() const;
    void open(const char* s, ios_base::openmode mode = ios_base::in);
    void open(const filesystem::path::value_type* s,
        ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
    void open(const string& s, ios_base::openmode mode = ios_base::in);
    void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
    void close();

private:
    basic_filebuf<charT, traits> sb;  // exposition only

    }\};

1 The class basic_ifstream<charT, traits> supports reading from named files. It uses a basic_filebuf<charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the filebuf object.

31.10.4.2 Constructors

basic_ifstream();

1 Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2.2) and sb with basic_filebuf<charT, traits>() (31.10.3.2).
explicit basic_ifstream(const char* s,  
ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,  
ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1

Effects: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and sb with `basic_filebuf<charT, traits>()` (31.10.3.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

explicit basic_ifstream(const string& s,  
ios_base::openmode mode = ios_base::in);

Effects: Equivalent to `basic_ifstream(s.c_str(), mode)`.

template<class T>
explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);

Constraints: `is_same_v<T, filesystem::path>` is true.

Effects: Equivalent to `basic_ifstream(s.c_str(), mode)`.

`basic_ifstream(basic_ifstream&& rhs);`

Effects: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

31.10.4.3 Swap

`void swap(basic_ifstream& rhs);`

Effects: Exchanges the state of `*this` and rhs by calling `basic_istream<charT, traits>::swap(rhs)` and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

Effects: Equivalent to `x.swap(y)`.

31.10.4.4 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

Returns: `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

native_handle_type native_handle() const noexcept;

Effects: Equivalent to: `return rdbuf()->native_handle();`

bool is_open() const;

Returns: `rdbuf()->is_open()`.

void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,  
ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1

Effects: Calls `rdbuf()->open(s, mode | ios_base::in)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);

Effects: Calls `open(s.c_str(), mode)`.

void close();

Effects: Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).
31.10.5 Class template basic_ofstream

31.10.5.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

            // 31.10.5.2, constructors
            basic_ofstream();
            explicit basic_ofstream(const char* s,
                ios_base::openmode mode = ios_base::out);
            explicit basic_ofstream(const filesystem::path::value_type* s,
                // wide systems only; see 31.10.1
                ios_base::openmode mode = ios_base::out);
            explicit basic_ofstream(const string& s,
                ios_base::openmode mode = ios_base::out);
            explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
            basic_ofstream(const basic_ofstream&) = delete;
            basic_ofstream(basic_ofstream&& rhs);
            basic_ofstream& operator=(const basic_ofstream&) = delete;
            basic_ofstream& operator=(basic_ofstream&& rhs);

            // 31.10.5.3, swap
            void swap(basic_ofstream& rhs);

            // 31.10.5.4, members
            basic_filebuf<charT, traits>* rdbuf() const;
            native_handle_type native_handle() const noexcept;
            bool is_open() const;
            void open(const char* s, ios_base::openmode mode = ios_base::out);
            void open(const filesystem::path::value_type* s,
                // wide systems only; see 31.10.1
                ios_base::openmode mode = ios_base::out);
            void open(const string& s, ios_base::openmode mode = ios_base::out);
            void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
            void close();

        private:
            basic_filebuf<charT, traits> sb;  // exposition only
        };
    }
}

1 The class basic_ofstream<charT, traits> supports writing to named files. It uses a basic_filebuf<
charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data
is presented here as:

(1.1) — sb, the filebuf object.

31.10.5.2 Constructors

basic_ofstream();

1 Effects: Initializes the base class with basic_ostream<
charT, traits>(addressof(sb)) (31.7.6.2.2)
and sb with basic_filebuf<
charT, traits>() (31.10.3.2).

explicit basic_ofstream(const char* s,
    ios_base::openmode mode = ios_base::out);

§ 31.10.5.2 1731
explicit basic_ofstream(const filesystem::path::value_type* s,
   ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1

Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb))
and sb with basic_filebuf<charT, traits>() (31.10.3.2), then calls rdbuf()->open(s, mode |
ios_base::out). If that function returns a null pointer, calls setstate(failbit).

explicit basic_ofstream(const string& s,
   ios_base::openmode mode = ios_base::out);

Effects: Equivalent to basic_ofstream(s.c_str(), mode).

template<class T>
explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);

Constraints: is_same_v<T, filesystem::path> is true.

Effects: Equivalent to basic_ofstream(s.c_str(), mode).

basic_ofstream(basic_ofstream&& rhs);

Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_-
ostream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

31.10.5.3 Swap [ofstream.swap]

void swap(basic_ofstream& rhs);

Effects: Exchanges the state of *this and rhs by calling basic_ostream<charT, traits>::swap(rhs)
and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);

Effects: Equivalent to x.swap(y).

31.10.5.4 Member functions [ofstream.members]

basic_filebuf<charT, traits>* rdbuf() const;

Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

native_handle_type native_handle() const noexcept;

Effects: Equivalent to: return rdbuf()->native_handle();

bool is_open() const;

Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s,
   ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1

Effects: Calls rdbuf()->open(s, mode | ios_base::out). If that function does not return a null
pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure)
(31.5.4.4).

void close();

Effects: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate(
failbit) (which may throw ios_base::failure) (31.5.4.4).

void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);

Effects: Calls open(s.c_str(), mode).

31.10.6 Class template basic_fstream [fstream]

31.10.6.1 General [fstream.general]

namespace std {
  template<class charT, class traits = char_traits<charT>>
The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `basic_filebuf` object.
31.10.6.2 Constructors  

**basic_fstream();**  

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`.  

**explicit basic_fstream(const char* s,**  

```cpp
const char* s,
ios_base::openmode mode = ios_base::in | ios_base::out);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

**explicit basic_fstream(const filesystem::path::value_type* s,**  

```cpp
const filesystem::path::value_type* s,
ios_base::openmode mode = ios_base::in | ios_base::out);  // wide systems only; see 31.10.1
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

**explicit basic_fstream(const string& s,**  

```cpp
const string& s,
ios_base::openmode mode = ios_base::in | ios_base::out);
```

*Effects:* Equivalent to `basic_fstream(s.c_str(), mode)`.

**template<class T>**  

```cpp
explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
```

*Constraints:* `is_same_v<T, filesystem::path>` is true.  

*Effects:* Equivalent to `basic_fstream(s.c_str(), mode)`.

**basic_fstream(basic_fstream&& rhs);**  

*Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

31.10.6.3 Swap  

**[fstream.swap]**  

**void swap(basic_fstream& rhs);**  

*Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

**template<class charT, class traits>**  

```cpp
void swap(basic_fstream<charT, traits>& x,  
         basic_fstream<charT, traits>& y);
```

*Effects:* Equivalent to `x.swap(y)`.

31.10.6.4 Member functions  

**[fstream.members]**  

**basic_filebuf<charT, traits>* rdbuf() const;**  

*Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.  

**native_handle_type native_handle() const noexcept;**  

*Effects:* Equivalent to: `return rdbuf()->native_handle();`

**bool is_open() const;**  

*Returns:* `rdbuf()->is_open()`.  

**void open(const char* s,**  

```cpp
const char* s,
ios_base::openmode mode = ios_base::in | ios_base::out);
```

**void open(const filesystem::path::value_type* s,**  

```cpp
const filesystem::path::value_type* s,
ios_base::openmode mode = ios_base::in | ios_base::out);  // wide systems only; see 31.10.1
```

*Effects:* Calls `rdbuf()->open(s, mode)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).
void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const filesystem::path& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

Effects: Calls open(s.c_str(), mode).

void close();

Effects: Calls rdbuf() \rightarrow close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

31.11 Synchronized output streams [syncstream]

31.11.1 Header <syncstream> synopsis [syncstream.syn]

#include <ostream> // see 31.7.2

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf;

    // 31.11.2.6, specialized algorithms
    template<class charT, class traits, class Allocator>
    void swap(basic_syncbuf<charT, traits, Allocator>&, basic_syncbuf<charT, traits, Allocator>&);

    using syncbuf = basic_syncbuf<char>;
    using wsyncbuf = basic_syncbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_osyncstream;

    using osyncstream = basic_osyncstream<char>;
    using wosyncstream = basic_osyncstream<wchar_t>;
}

1 The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

31.11.2 Class template basic_syncbuf [syncstream.syncbuf]

31.11.2.1 Overview [syncstream.syncbuf.overview]

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;

            using streambuf_type = basic_streambuf<charT, traits>;

        } // 31.11.2.2, construction and destruction

        basic_syncbuf() : basic_syncbuf(nullptr) {}
        explicit basic_syncbuf(streambuf_type* obuf) : basic_syncbuf(obuf, Allocator()) {}
        basic_syncbuf(streambuf_type*, const Allocator&);
        basic_syncbuf(basic_syncbuf&&);
        ~basic_syncbuf();
Class template `basic_syncbuf` stores character data written to it, known as the associated output, into internal buffers allocated using the object’s allocator. The associated output is transferred to the wrapped stream buffer object `*wrapped` when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

### 31.11.2.2 Construction and destruction

```cpp
basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
```

**Effects:** Sets `wrapped` to `obuf`.

**Postconditions:** `get_wrapped() == obuf` and `get_allocator() == allocator` are true.

**Throws:** Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

**Remarks:** A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

```cpp
basic_syncbuf(basic_syncbuf&& other);
```

**Postconditions:** The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.pbase() == other.pptr()` and `other.get_wrapped() == nullptr` are true.

**Remarks:** This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

```cpp
~basic_syncbuf();
```

**Effects:** Calls `emit()`.

**Throws:** Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

### 31.11.2.3 Assignment and swap

```cpp
basic_syncbuf& operator=(basic_syncbuf&& rhs);
```

**Effects:** Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (31.11.2.2).

**Postconditions:**

1. `rhs.get_wrapped() == nullptr` is true.
2. `this->get_allocator() == rhs.get_allocator()` is true when `allocator_traits<Allocator>::propagate_on_container_move_assignment::value` is true; otherwise, the allocator is unchanged.
3 Returns: *this.
4 Remarks: This assignment operator disassociates rhs from its wrapped stream buffer, ensuring
destruction of rhs produces no output.

void swap(basic_syncbuf& other);
5
6 Preconditions: Either allocator_traits<Allocator>::propagate_on_container_swap::value is
true or this->get_allocator() == other.get_allocator() is true.

Effects: Exchanges the state of *this and other.

31.11.2.4 Member functions

bool emit();
1 Effects: Atomically transfers the associated output of *this to the stream buffer *wrapped, so that it
appears in the output stream as a contiguous sequence of characters. wrapped->pubsync() is called if
and only if a call was made to sync() since the most recent call to emit(), if any.

Synchronization: All emit() calls transferring characters to the same stream buffer object appear to
execute in a total order consistent with the “happens before” relation (6.9.2.2), where each emit() call
synchronizes with subsequent emit() calls in that total order.

Postconditions: On success, the associated output is empty.

4 Returns: true if all of the following conditions hold; otherwise false:
(4.1) wrapped == nullptr is false.
(4.2) All of the characters in the associated output were successfully transferred.
(4.3) The call to wrapped->pubsync() (if any) succeeded.

Remarks: May call member functions of wrapped while holding a lock uniquely associated with wrapped.

streambuf_type* get_wrapped() const noexcept;
6

Returns: wrapped.

allocator_type get_allocator() const noexcept;
7

Returns: A copy of the allocator that was set in the constructor or assignment operator.

void set_emit_on_sync(bool b) noexcept;
8

Effects: emit_on_sync = b.

31.11.2.5 Overridden virtual functions

int sync() override;
1

Effects: Records that the wrapped stream buffer is to be flushed. Then, if emit_on_sync is true, calls
emit().

[Note 1: If emit_on_sync is false, the actual flush is delayed until a call to emit(). — end note]

2 Returns: If emit() was called and returned false, returns -1; otherwise 0.

31.11.2.6 Specialized algorithms

template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,

basic_syncbuf<charT, traits, Allocator>& b);
1

Effects: Equivalent to a.swap(b).

31.11.3 Class template basic_osyncstream

31.11.3.1 Overview

namespace std {

template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
class basic_osyncstream : public basic_ostream<charT, traits> {

public:

using char_type = charT;

§ 31.11.3.1 1737
using int_type = typename traits::int_type;
using pos_type = typename traits::pos_type;
using off_type = typename traits::off_type;
using traits_type = traits;
using allocator_type = Allocator;
using streambuf_type = basic_streambuf<charT, traits>;
using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;

// 31.11.3.2, construction and destruction
basic_osyncstream(streambuf_type*, const Allocator&);
explicit basic_osyncstream(streambuf_type* obuf)
 : basic_osyncstream(obuf, Allocator()) {}
explicit basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator)
 : basic_osyncstream(os.rdbuf(), allocator) {}
explicit basic_osyncstream(basic_ostream<charT, traits>&& os)
 : basic_osyncstream(os, Allocator()) {}
basic_osyncstream(basic_osyncstream&&) noexcept;
~basic_osyncstream();

// assignment
basic_osyncsteam& operator=(basic_osyncstream&&);

// 31.11.3.3, member functions
void emit();
streambuf_type* get_wrapped() const noexcept;
syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); } } 

private:
 syncbuf_type sb; // exposition only
};

1 Allocator shall meet the Cpp17Allocator requirements (16.4.4.6.1).

2 [Example 1: A named variable can be used within a block statement for streaming.

```
{ osyncstream bout(cout);
bout << "Hello, ";
bout << "World!";
bout << endl; // flush is noted
bout << "and more!\n";
} // characters are transferred and cout is flushed
```
— end example]

3 [Example 2: A temporary object can be used for streaming within a single statement.

```
osyncstream(cout) << "Hello, " << "World!" << '\n';
```
In this example, cout is not flushed. — end example]

31.11.3.2 Construction and destruction [syncstream.osyncstream.cons]

basic_osyncstream(streambuf_type* buf, const Allocator& allocator);

1 Effects: Initializes sb from buf and allocator. Initializes the base class with basic_ostream<charT, traits>(addressof(sb)).

2 [Note 1: The member functions of the provided stream buffer can be called from emit() while a lock is held, which might result in a deadlock if used incautiously. — end note]

3 Postconditions: get_wrapped() == buf is true.

basic_osyncstream(basic_osyncstream&& other) noexcept;

4 Effects: Move constructs the base class and sb from the corresponding subobjects of other, and calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)).
Postconditions: The value returned by \texttt{get\_wrapped()} is the value returned by \texttt{other.get\_wrapped()} prior to calling this constructor. \texttt{nullptr == other.get\_wrapped()} is true.

31.11.3.3 Member functions

\begin{verbatim}
void emit();
\end{verbatim}

\textbf{Effects:} Behaves as an unformatted output function (31.7.6.4). After constructing a \texttt{sentry} object, calls \texttt{sb.emit()}. If that call returns false, calls \texttt{setstate(ios\_base::badbit)}.

[Example 1: A flush on a basic\_osyncstream does not flush immediately:

\begin{verbatim}
{ osyncstream bout(cout);
  bout << "Hello," << 'n';  // no flush
  bout.emit();            // characters transferred; cout not flushed
  bout << "World!" << endl; // flush noted; cout not flushed
  bout.emit();            // characters transferred; cout flushed
  bout << "Greetings." << 'n'; // no flush
} // characters transferred; cout not flushed
—end example]

31.12 File systems

31.12.1 General

Subclause 31.12 describes operations on file systems and their components, such as paths, regular files, and directories.

A \textit{file system} is a collection of files and their attributes.

A \textit{file} is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.
A directory is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The parent directory of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (31.12.6.2) in the given directory. The parent directory of other types of files is a directory containing a directory entry for the file under discussion.

A link is an object that associates a filename with a file. Several links can associate names with the same file. A hard link is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed.

[Note 1: A hard link can be thought of as a shared-ownership smart pointer to a file. — end note]

A symbolic link is a type of file with the property that when the file is encountered during pathname resolution (31.12.6), a string stored by the file is used to modify the pathname resolution.

[Note 2: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a "dangling" symbolic link. — end note]

31.12.2 Conformance

31.12.2.1 General

Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

31.12.2.2 POSIX conformance

Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.

[Note 1: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — end note]

Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 31.12.5.

[Note 2: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — end note]

Implementations are not required to provide behavior that is not supported by a particular file system.

[Example 1: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — end example]

31.12.2.3 Operating system dependent behavior conformance

Behavior that is specified as being operating system dependent is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.

It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

31.12.2.4 File system race behavior

A file system race is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 31.12 introduce a file system race.

If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, Preconditions: is not specified for the function.

[Note 1: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — end note]
31.12.3 Requirements [fs.req]

1 Throughout subclause 31.12, char, wchar_t, char8_t, char16_t, and char32_t are collectively called encoded character types.

2 Functions with template parameters named EcharT shall not participate in overload resolution unless EcharT is one of the encoded character types.

3 Template parameters named InputIterator shall meet the Cpp17InputIterator requirements (25.3.5.3) and shall have a value type that is one of the encoded character types.

4 [Note 1: Use of an encoded character type implies an associated character set and encoding. Since signed char and unsigned char have no implied character set and encoding, they are not included as permitted types. — end note]

5 Template parameters named Allocator shall meet the Cpp17Allocator requirements (16.4.4.6.1).

31.12.4 Header <filesystem> synopsis [fs.filesystem.syn]

```cpp
#include <compare>  // see 17.11.1

namespace std::filesystem {
    // 31.12.6, paths
    class path;

    // 31.12.6.8, path non-member functions
    void swap(path& lhs, path& rhs) noexcept;
    size_t hash_value(const path& p) noexcept;

    // 31.12.7, filesystem errors
    class filesystem_error;

    // 31.12.10, directory entries
    class directory_entry;

    // 31.12.11, directory iterators
    class directory_iterator;

    // 31.12.11.3, range access for directory iterators
    directory_iterator begin(directory_iterator iter) noexcept;
    directory_iterator end(directory_iterator) noexcept;

    // 31.12.12, recursive directory iterators
    class recursive_directory_iterator;

    // 31.12.12.3, range access for recursive directory iterators
    recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;
    recursive_directory_iterator end(recursive_directory_iterator) noexcept;

    // 31.12.9, file status
    class file_status;

    struct space_info {
       uintmax_t capacity;
       uintmax_t free;
       uintmax_t available;
    
       friend bool operator==(const space_info&, const space_info&) = default;
    };  

    // 31.12.8, enumerations
    enum class file_type;
    enum class perms;

1 Implementations should ensure that the resolution and range of file_time_type reflect the operating system dependent resolution and range of file time values.

31.12.5 Error reporting

Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an error_code.

[Note 1: This supports two common use cases:

(1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.

(1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.

— end note]

2 Functions not having an argument of type error_code& handle errors as follows, unless otherwise specified:

(2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type filesystem_error shall be thrown. For functions with a single path argument, that argument shall be passed to the filesystem_error constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the filesystem_error constructor as the path1 argument, and the second shall be passed as the path2 argument. The filesystem_error constructor’s error_code argument is set as appropriate for the specific operating system dependent error.
Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

Destructors throw nothing.

Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

### 31.12.6 Class path

#### 31.12.6.1 General

An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

[Note 1: Class `path` is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — end note]

A path is a sequence of elements that identify the location of a file within a filesystem. The elements are the `root-name_opt`, `root-directory_opt`, and an optional sequence of filenames (31.12.6.2). The maximum number of elements in the sequence is operating system dependent (31.12.2.3).

An absolute path is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A relative path is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.

[Note 2: Pathnames "." and "." are relative paths. — end note]

A pathname is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (31.12.6.2) or according to an operating system dependent `native pathname format` accepted by the host operating system.

Pathname resolution is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

[Example 1: POSIX specifies the mechanism in section 4.12, Pathname resolution. — end example]

```cpp
namespace std::filesystem {
    class path {
        public:
            using value_type = see below;
            using string_type = basic_string<value_type>;
            static constexpr value_type preferred_separator = see below;

            // 31.12.8.1, enumeration format
            enum format;

            // 31.12.6.5.1, constructors and destructor
            path() noexcept;
            path(const path& p);
            path(path&& p) noexcept;
            path(string_type&& source, format fmt = auto_format);
            template<class Source>
                path(const Source& source, format fmt = auto_format);
            template<class InputIterator>
                path(InputIterator first, InputIterator last, format fmt = auto_format);
            template<class Source>
                path(const Source& source, const locale& loc, format fmt = auto_format);
            template<class InputIterator>
                path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
            ~path();

            // 31.12.6.5.2, assignments
            path& operator=(const path& p);

    } // namespace std::filesystem
```
path& operator=(path&& p) noexcept;
path& operator=(string_type&& source);
path& assign(string_type&& source);

// 31.12.6.5.3, appends
path& operator/=(const path& p);

// 31.12.6.5.4, concatenation
path& operator+=(const path& x);

class iterator;
using const_iterator = iterator;

iterator begin() const;
iterator end() const;

friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const path& p);
friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, path& p);

value_type is a typedef for the operating system dependent encoded character type used to represent
pathnames.
The value of the `preferred_separator` member is the operating system dependent `preferred-separator` character (31.12.6.2).

[Example 2: For POSIX-based operating systems, `value_type` is `char` and `preferred_separator` is the slash character (`'/'`). For Windows-based operating systems, `value_type` is `wchar_t` and `preferred_separator` is the backslash character (`L'\'`). — end example]

### 31.12.6.2 Generic pathname format

```plaintext
pathname:
  root-name_opt root-directory_opt relative-path

root-name:
  operating system dependent sequences of characters
  implementation-defined sequences of characters

root-directory:
  directory-separator

relative-path:
  filename
  filename directory-separator relative-path
  an empty path

directory-separator:
  preferred-separator directory-separator_opt
  fallback-separator directory-separator_opt

preferred-separator:
  operating system dependent directory separator character

fallback-separator:
  /, if `preferred-separator` is not /
```

1 A `filename` is the name of a file. The `dot` and `dot-dot` filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

1.1 — The permitted characters.

[Example 1: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — end example]

[Note 1: Wider portability can be achieved by limiting `filename` characters to the POSIX Portable Filename Character Set:

```
ABCDEFGHIJKLMNOPQRSTUVWXYZ
abcdefghijklmnopqrstuvwxyz
0123456789_-
```
— end note]

1.2 — The maximum permitted length.

1.3 — Filenames that are not permitted.

1.4 — Filenames that have special meaning.

1.5 — Case awareness and sensitivity during path resolution.

1.6 — Special rules that may apply to file types other than regular files, such as directories.

2 Except in a `root-name`, multiple successive `directory-separator` characters are considered to be the same as one `directory-separator` character.

3 The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to `root-directory` is implementation-defined. Specific filenames may have special meanings for a particular operating system.

4 A `root-name` identifies the starting location for pathname resolution (31.12.6). If there are no operating system dependent `root-names`, at least one implementation-defined `root-name` is required.

[Note 2: Many operating systems define a name beginning with two `directory-separator` characters as a `root-name` that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier — a `root-name` identifying a specific device such as a disk drive. — end note]
If a root-name is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.

[Note 3: On a POSIX-like operating system, it is impossible to have a root-name and a relative-path without an intervening root-directory element. — end note]

Normalization of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the root-name with a preferred-separator.
3. Replace each directory-separator with a preferred-separator.
   [Note 4: The generic pathname grammar defines directory-separator as one or more slashes and preferred-separators. — end note]
4. Remove each dot filename and any immediately following directory-separator.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a directory-separator and a dot-dot filename, along with any immediately following directory-separator.
6. If there is a root-directory, remove all dot-dot filenames and any directory-separators immediately following them.
   [Note 5: These dot-dot filenames attempt to refer to nonexistent parent directories. — end note]
7. If the last filename is dot-dot, remove any trailing directory-separator.
8. If the path is empty, add a dot.

The result of normalization is a path in normal form, which is said to be normalized.

31.12.6.3 Conversions

31.12.6.3.1 Argument format conversions

[fs.path.cvt]

1 [Note 1: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:

(1.1) — The generic format is acceptable as a native path.
(1.2) — There is no need to distinguish between native format and generic format in function arguments.
(1.3) — Paths for regular files and paths for directories share the same syntax.
  — end note]

2 Several functions are defined to accept detected-format arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (31.12.6.2) or a pathname in the native format (31.12.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

3 [Note 2: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — end note]

4 Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let \( G(n) \) and \( N(g) \) in a mathematical sense be the implementation’s functions that convert native-to-generic and generic-to-native formats respectively. If \( g=G(n) \) for some \( n \), then \( G(N(g))=g \); if \( n=N(g) \) for some \( g \), then \( N(G(n))=n \).

[Note 3: Neither \( G \) nor \( N \) need be invertible. — end note]

5 If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a directory-separator, otherwise it shall be treated as a path to a regular file.

6 [Note 4: A path stores a native format pathname (31.12.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — end note]

7 When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function (\( G \) or \( N \)).

8 When the (new) value \( p \) of one representation of a path is derived from the representation of that or another path, a value \( q \) is chosen for the other representation. The value \( q \) converts to \( p \) (by \( G \) or \( N \) as appropriate) if any such value does so; \( q \) is otherwise unspecified.
[Note 5: If \( q \) is the result of converting any path at all, it is the result of converting \( p \). — end note]

31.12.6.3.2 Type and encoding conversions

The native encoding of an ordinary character string is the operating system dependent current encoding for pathnames (31.12.6). The native encoding for wide character strings is the implementation-defined execution wide-character set encoding (16.3.3.3.4).

For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

1. **char**: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.
   
   [Note 1: For POSIX-based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. — end note]
   
   [Note 2: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error-prone. — end note]

2. **wchar_t**: The encoding is the native wide encoding. The method of conversion is unspecified.
   
   [Note 3: For Windows-based operating systems `path::value_type` is `wchar_t` so no conversion from `wchar_t` value type arguments or to `wchar_t` value type return values is performed. — end note]

3. **char8_t**: The encoding is UTF-8. The method of conversion is unspecified.

4. **char16_t**: The encoding is UTF-16. The method of conversion is unspecified.

5. **char32_t**: The encoding is UTF-32. The method of conversion is unspecified.

If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type `path::value_type`.

31.12.6.4 Requirements

In addition to the requirements (31.12.3), function template parameters named `Source` shall be one of:

1. **basic_string<EcharT, traits, Allocator>**: A function argument `const Source& source` shall have an effective range `[source.begin(), source.end())].

2. **basic_string_view<EcharT, traits>**: A function argument `const Source& source` shall have an effective range `[source.begin(), source.end())].

3. A type meeting the `Cpp17InputIterator` requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<Source>::value_type()`.

4. A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<decay_t<Source>>::value_type()`.

Functions taking template parameters named `Source` shall not participate in overload resolution unless `Source` denotes a type other than `path`, and either

1. **Source** is a specialization of `basic_string` or `basic_string_view`, or

2. **the qualified-id** `iterator_traits<decay_t<Source>>::value_type` is valid and denotes a possibly const encoded character type (13.10.3).

[Note 1: See path conversions (31.12.6.3) for how the value types above and their encodings convert to `path::value_type` and its encoding. — end note]

Arguments of type `Source` shall not be null pointers.
31.12.6.5 Members

31.12.6.5.1 Constructors

path() noexcept;

   Postconditions: empty() == true.

path(const path& p);
path(path&& p) noexcept;

   Effects: Constructs an object of class path having the same pathname in the native and generic formats, respectively, as the original value of p. In the second form, p is left in a valid but unspecified state.

path(string_type&& source, format fmt = auto_format);

   Effects: Constructs an object of class path for which the pathname in the detected-format of source has the original value of source (31.12.6.3.1), converting format if required (31.12.6.3.1). source is left in a valid but unspecified state.

template<class Source>
path(const Source& source, format fmt = auto_format);

   template<class InputIterator>
path(InputIterator first, InputIterator last, format fmt = auto_format);

   Effects: Let s be the effective range of source (31.12.6.4) or the range [first, last), with the encoding converted if required (31.12.6.4). Finds the detected-format of s (31.12.6.3.1) and constructs an object of class path for which the pathname in that format is s.

template<class Source>
path(const Source& source, const locale& loc, format fmt = auto_format);

   template<class InputIterator>
path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);

   Mandates: The value type of Source and InputIterator is char.

   Effects: Let s be the effective range of source or the range [first, last), after converting the encoding as follows:

   (6.1) If value_type is wchar_t, converts to the native wide encoding (31.12.6.3.2) using the codecvt<wchar_t, char, mbstate_t> facet of loc.

   (6.2) Otherwise a conversion is performed using the codecvt<wchar_t, char, mbstate_t> facet of loc, and then a second conversion to the current ordinary encoding.

   Finds the detected-format of s (31.12.6.3.1) and constructs an object of class path for which the pathname in that format is s.

   [Example 1: A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));

For POSIX-based operating systems, the path is constructed by first using latin1_facet to convert ISO/IEC 8859-1 encoded latin1_string to a wide character string in the native wide encoding (31.12.6.3.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using latin1_facet to convert ISO/IEC 8859-1 encoded latin1_string to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation. — end example]
### 31.12.6.5.2 Assignments

**path& operator=(const path& p);**

1. **Effects:** If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`.
2. **Returns:** `*this`.

**path& operator=(path&& p) noexcept;**

3. **Effects:** If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`. `p` is left in a valid but unspecified state.
4. **[Note 1]:** A valid implementation is `swap(p)`. — end note
5. **Returns:** `*this`.

**path& operator=(string_type&& source);**

6. **Effects:** Sets the pathname in the detected-format of `source` to the original value of `source`. `source` is left in a valid but unspecified state.
7. **Returns:** `*this`.

**template<class Source>
path& operator=(const Source& source);**

8. **Effects:** Let `s` be the effective range of `source` (31.12.6.4) or the range `[first, last)`, with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and sets the pathname in that format to `s`.
9. **Returns:** `*this`.

### 31.12.6.5.3 Appends

**path& operator/=(const path& p);**

1. **Effects:** If `p.is_absolute() || (p.has_root_name() && p.root_name() != root_name())`, then `operator=(p)`. Otherwise, modifies `*this` as if by these steps:
   - If `p.has_root_directory()`, then removes any root directory and relative path from the generic format pathname. Otherwise, if `has_root_directory() && is_absolute()` is true or if `has_separator()` is true, then appends `path::preferred_separator` to the generic format pathname.
   - Then appends the native format pathname of `p`, omitting any `root-name` from its generic format pathname, to the native format pathname.
2. **[Example 1]:** Even if `//host` is interpreted as a `root-name`, both of the paths `path("//host")/"foo"` and `path("//host")/"foo"` equal `"//host/foo"` (although the former might use backslash as the preferred separator).

Expression examples:

// On POSIX,
path("foo") /= path(""); // yields path("foo")
path("foo") /= path("/bar"); // yields path("/bar")

// On Windows,
path("foo") /= path(""); // yields path("foo\")
path("foo") /= path("/bar"); // yields path("/bar")
path("foo") /= path("c:/bar"); // yields path("c:/bar")
path("foo") /= path("c:"); // yields path("c:")

§ 31.12.6.5.3
path("c:" /= path(""));       // yields path("c:")
path("c:foo") /= path("/bar"); // yields path("c:/bar")
path("c:foo") /= path("c:bar"); // yields path("c:foo\bar")

—end example]

5

Returns: *this.

template<class Source>
path& operator/(const Source& source);
template<class Source>
path& append(const Source& source);

6

Effects: Equivalent to: return operator/(path(source));

template<class InputIterator>
path& append(InputIterator first, InputIterator last);

7

Effects: Equivalent to: return operator/(path(first, last));

31.12.6.5.4 Concatenation [fs.path.concat]

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
path& operator+=(const Source& x);
template<class Source>
path& concat(const Source& x);

1

Effects: Appends path(x).native() to the pathname in the native format.

[Note 1: This directly manipulates the value of native(), which is not necessarily portable between operating systems. — end note]

2

Returns: *this.

path& operator+=(value_type x);
template<class EcharT>
path& operator+=(EcharT x);

3

Effects: Equivalent to: return *this += basic_string_view(&x, 1);

template<class InputIterator>
path& concat(InputIterator first, InputIterator last);

4

Effects: Equivalent to: return *this += path(first, last);

31.12.6.5.5 Modifiers [fs.path.modifiers]

void clear() noexcept;

Postconditions: empty() == true.

path& make_preferred();

2

Effects: Each directory-separator of the pathname in the generic format is converted to preferred-separator.

3

Returns: *this.

4

[Example 1:
   path p("foo/bar");
   std::cout << p << '\n';
   p.make_preferred();
   std::cout << p << '\n';

On an operating system where preferred-separator is a slash, the output is:
"foo/bar"
"foo/bar"

On an operating system where preferred-separator is a backslash, the output is:
path& remove_filename();

*Effects:* Remove the generic format pathname of filename() from the generic format pathname.
*Postconditions:* !has_filename().
*Returns:* *this.

[Example 2:
path("foo/bar").remove_filename(); // yields "foo/"
path("foo/").remove_filename(); // yields "foo/"
path("/foo").remove_filename(); // yields "/"
path("/").remove_filename(); // yields "/"
— end example]

path& replace_filename(const path& replacement);

*Effects:* Equivalent to:
remove_filename();
operator/=(replacement);
*Returns:* *this.

[Example 3:
path("/foo").replace_filename("bar"); // yields "/bar" on POSIX
path("/").replace_filename("bar"); // yields "/bar" on POSIX
— end example]

path& replace_extension(const path& replacement = path());

(12.1) Any existing extension() (31.12.5.9) is removed from the pathname in the generic format, then
(12.2) If replacement is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then
(12.3) operator+=(replacement);
*Returns:* *this.

void swap(path& rhs) noexcept;

*Effects:* Swaps the contents (in all formats) of the two paths.
*Complexity:* Constant time.

31.12.6.5.6 Native format observers [fs.path.native.obs]
The string returned by all native format observers is in the native pathname format (31.12.6).

const string_type& native() const noexcept;
*Returns:* The pathname in the native format.

const value_type* c_str() const noexcept;
*Effects:* Equivalent to: return native().c_str();
*Returns:* native().

template<class EcharT, class traits = char_traits<EcharT>,
class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
string(const Allocator& a = Allocator()) const;
*Returns:* native().
Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

std::string string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;

Returns: native().

Remarks: Conversion, if any, is performed as specified by 31.12.6.3.

31.12.6.5.7 Generic format observers

Generic format observer functions return strings formatted according to the generic pathname format (31.12.6.2). A single slash (‘/’) character is used as the directory-separator.

[Example 1: On an operating system that uses backslash as its preferred-separator,
   path("foo\bar").generic_string()
   returns "foo/bar". — end example]

template<class EcharT, class traits = char_traits<EcharT>,
class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
generic_string(const Allocator& a = Allocator()) const;

Returns: The pathname in the generic format.

Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;

Returns: The pathname in the generic format.

Remarks: Conversion, if any, is specified by 31.12.6.3.

31.12.6.5.8 Compare

int compare(const path& p) const noexcept;

Returns:

(1.1) — Let rootNameComparison be the result of this->root_name().native().compare(p.root_name().native()). If rootNameComparison is not 0, rootNameComparison.

(1.2) — Otherwise, if !this->has_root_directory() and p.has_root_directory(), a value less than 0.

(1.3) — Otherwise, if this->has_root_directory() and !p.has_root_directory(), a value greater than 0.

(1.4) — Otherwise, if native() for the elements of this->relative_path() are lexicographically less than native() for the elements of p.relative_path(), a value less than 0.

(1.5) — Otherwise, if native() for the elements of this->relative_path() are lexicographically greater than native() for the elements of p.relative_path(), a value greater than 0.

(1.6) — Otherwise, 0.

int compare(const string_type& s) const;
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const;

Effects: Equivalent to: return compare(path(s));
31.12.6.5.9 Decomposition

path root_name() const;
Returns: root-name, if the pathname in the generic format includes root-name, otherwise path().

path root_directory() const;
Returns: root-directory, if the pathname in the generic format includes root-directory, otherwise path().

path root_path() const;
Returns: root_name() / root_directory().

path relative_path() const;
Returns: A path composed from the pathname in the generic format, if empty() is false, beginning with the first filename after root_path(). Otherwise, path().

path parent_path() const;
Returns: *this if has_relative_path() is false, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of *this that produces one fewer element in its iteration.

path filename() const;
Returns: relative_path().empty() ? path() : *--end().

[Example 1:
  path("/foo/bar.txt").filename(); // yields "bar.txt"
  path("/foo/bar").filename(); // yields "bar"
  path("/foo/bar/").filename(); // yields ""
  path("/").filename(); // yields ""
  path("//host").filename(); // yields ""
  path(".").filename(); // yields "."
  path("..").filename(); // yields "."
— end example]

path stem() const;
Returns: Let f be the generic format pathname of filename(). Returns a path whose pathname in the generic format is

— f, if it contains no periods other than a leading period or consists solely of one or two periods;
— otherwise, the prefix of f ending before its last period.

[Example 2:
  std::cout << path("/foo/bar.txt").stem(); // outputs "bar"
  path p = "foo.bar.baz.tar";
  for (; !p.extension().empty(); p = p.stem())
    std::cout << p.extension() << \\
    // outputs: .tar \\
    // .baz \\
    // .bar
— end example]

path extension() const;
Returns: A path whose pathname in the generic format is the suffix of filename() not included in stem().

[Example 3:
  path("/foo/bar.txt").extension(); // yields ".txt" and stem() is "bar"
  path("/foo/bar").extension(); // yields "" and stem() is "bar"
  path("/foo/profile").extension(); // yields "" and stem() is ".profile"
  path("bar").extension(); // yields "" and stem() is ".bar"
  path("..bar").extension(); // yields ".bar" and stem() is "."
— end example]
[Note 1: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. — end note]

[Note 2: On non-POSIX operating systems, for a path p, it is possible that p.stem() + p.extension() == p.filename() is false, even though the generic format pathnames are the same. — end note]

31.12.6.5.10 Query

[[nodiscard]] bool empty() const noexcept;

Returns: true if the pathname in the generic format is empty, otherwise false.

bool has_root_path() const;

Returns: !root_path().empty().

bool has_root_name() const;

Returns: !root_name().empty().

bool has_root_directory() const;

Returns: !root_directory().empty().

bool has_relative_path() const;

Returns: !relative_path().empty().

bool has_parent_path() const;

Returns: !parent_path().empty().

bool has_filename() const;

Returns: !filename().empty().

bool has_stem() const;

Returns: !stem().empty().

bool has_extension() const;

Returns: !extension().empty().

bool is_absolute() const;

Returns: true if the pathname in the native format contains an absolute path (31.12.6), otherwise false.

[Example 1: path("/").is_absolute() is true for POSIX-based operating systems, and false for Windows-based operating systems. — end example]

bool is_relative() const;

Returns: !is_absolute().

31.12.6.5.11 Generation

path lexically_normal() const;

Returns: A path whose pathname in the generic format is the normal form (31.12.6.2) of the pathname in the generic format of *this.

[Example 1:
assert(path("foo/../bar/..").lexically_normal() == "foo/");
assert(path("foo/./bar/...").lexically_normal() == "foo/");
The above assertions will succeed. On Windows, the returned path’s directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example]

path lexically_relative(const path& base) const;

Effects: If:

(3.1) — root_name() != base.root_name() is true, or
(3.2) — is_absolute() != base.is_absolute() is true, or
---has_root_directory() && base.has_root_directory() is true, or
---any filename in relative_path() or base.relative_path() can be interpreted as a root-name, returns path().

[Note 1: On a POSIX implementation, no filename in a relative-path is acceptable as a root-name. — end note]

Determines the first mismatched element of *this and base as if by:

auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());

Then,

---if a == end() and b == base.end(), returns path("."); otherwise
---let n be the number of filename elements in [b, base.end()) that are not dot or dot-dot or empty, minus the number that are dot-dot. If n<0, returns path(); otherwise
---if n == 0 and (a == end() || a->empty()), returns path("."); otherwise
---returns an object of class path that is default-constructed, followed by
---application of operator/(path(".")) n times, and then
---application of operator/ for each element in [a, end()).

Returns: *this made relative to base. Does not resolve (31.12.6) symlinks. Does not first normalize (31.12.6.2) *this or base.

[Example 2:]

assert(path("/a/d").lexically_relative("/a/b/c") == "./../d");
assert(path("/a/b/c").lexically_relative("/a/d") == ".../b/c");
assert(path("a/b/c").lexically_relative("a") == ".c");
assert(path("a/b/c").lexically_relative("a/b/c/a/y") == ".../..");
assert(path("a/b/c").lexically_relative("a/b/c") == ".c");
assert(path("a/b").lexically_relative("c/d") == ".../a/b");

The above assertions will succeed. On Windows, the returned path's directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example]

[Note 2: If symlink following semantics are desired, use the operational function relative(). — end note]

[Note 3: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply lexically-normal() to *this, base, or both. — end note]

path lexically_proximate(const path& base) const;

Returns: If the value of lexically_relative(base) is not an empty path, return it. Otherwise return *this.

[Note 4: If symlink following semantics are desired, use the operational function proximate(). — end note]

[Note 5: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply lexically-normal() to *this, base, or both. — end note]

31.12.6.6 Iterators

Path iterators iterate over the elements of the pathname in the generic format (31.12.6.2).

A path::iterator is a constant iterator meeting all the requirements of a bidirectional iterator (25.3.5.6) except that, for dereferenceable iterators a and b of type path::iterator with a == b, there is no requirement that *a and *b are bound to the same object. Its value_type is path.

Calling any non-const member function of a path object invalidates all iterators referring to elements of that object.

For the elements of the pathname in the generic format, the forward traversal order is as follows:

---The root-name element, if present.
---The root-directory element, if present.

[Note 1: The generic format is required to ensure lexicographical comparison works correctly. — end note]

---Each successive filename element, if present.
---An empty element, if a trailing non-root directory-separator is present.
The backward traversal order is the reverse of forward traversal.

iterator begin() const;

Returns: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

iterator end() const;

Returns: The end iterator.

31.12.6.7 Inserter and extractor

[fs.path.io]

```cpp
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);
```

Effects: Equivalent to `os << quoted(p.string<charT, traits>())`.

[Note 1: The quoted function is described in 31.7.9. — end note]

Returns: `os`.

```cpp
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);
```

Effects: Equivalent to:

```cpp
basic_string<charT, traits> tmp;
is >> quoted(tmp);
p = tmp;
```

Returns: `is`.

31.12.6.8 Non-member functions

[fs.path.nonmember]

```cpp
void swap(path& lhs, path& rhs) noexcept;
```

Effects: Equivalent to `lhs.swap(rhs)`.

```cpp
size_t hash_value(const path& p) noexcept;
```

Returns: A hash value for the path `p`. If for two paths, `p1 == p2` then `hash_value(p1) == hash_value(p2)`.

```cpp
friend bool operator==(const path& lhs, const path& rhs) noexcept;
```

Returns: `lhs.compare(rhs) == 0`.

[Note 1: Path equality and path equivalence have different semantics.

(4.1) Equality is determined by the path non-member operator==, which considers the two paths’ lexical representations only.

[Example 1: `path("foo") == "bar"` is never true. — end example]

(4.2) Equivalence is determined by the equivalent() non-member function, which determines if two paths resolve (31.12.6) to the same file system entity.

[Example 2: `equivalent("foo", "bar")` will be `true` when both paths resolve to the same file. — end example]

— end note]

```cpp
friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;
```

Returns: `lhs.compare(rhs) <=> 0`.

```cpp
friend path operator/(const path& lhs, const path& rhs);
```

Effects: Equivalent to: `return path(lhs) /= rhs;`
31.12.6.9 Hash support

```
template<> struct hash<filesystem::path>;
```

For an object `p` of type `filesystem::path`, `hash<filesystem::path>()(p)` evaluates to the same result as `filesystem::hash_value(p)`.

31.12.7 Class filesystem_error

31.12.7.1 General

```
namespace std::filesystem {
    class filesystem_error : public system_error {
        public:
            filesystem_error(const string& what_arg, error_code ec);
            filesystem_error(const string& what_arg,
                const path& p1, error_code ec);
            filesystem_error(const string& what_arg,
                const path& p1, const path& p2, error_code ec);

            const path& path1() const noexcept;
            const path& path2() const noexcept;
            const char* what() const noexcept override;
    };
}
```

The class `filesystem_error` defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 31.12.

31.12.7.2 Members

```
filesystem_error(const string& what_arg, error_code ec);
```

Postconditions:

(1) `code() == ec`,
(2) `path1().empty() == true`,
(3) `path2().empty() == true`, and
(4) `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

```
filesystem_error(const string& what_arg, const path& p1, error_code ec);
```

Postconditions:

(1) `code() == ec`,
(2) `path1()` returns a reference to the stored copy of `p1`,
(3) `path2().empty() == true`, and
(4) `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

```
filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);
```

Postconditions:

(1) `code() == ec`,
(2) `path1()` returns a reference to the stored copy of `p1`,
(3) `path2()` returns a reference to the stored copy of `p2`, and
(4) `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

```
const path& path1() const noexcept;
```

Returns: A reference to the copy of `p1` stored by the constructor, or, if none, an empty path.

```
const path& path2() const noexcept;
```

Returns: A reference to the copy of `p2` stored by the constructor, or, if none, an empty path.
const char* what() const noexcept override;

Returns: An nntbs that incorporates the what_arg argument supplied to the constructor. The exact format is unspecified. Implementations should include the system_error::what() string and the pathnames of path1 and path2 in the native format in the returned string.

31.12.8 Enumerations [fs.enum]

31.12.8.1 Enum path::format [fs.enum.path.format]

This enum specifies constants used to identify the format of the character sequence, with the meanings listed in Table 130.

Table 130: Enum path::format [tab:fs.enum.path.format]

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>native_format</td>
<td>The native pathname format.</td>
</tr>
<tr>
<td>generic_format</td>
<td>The generic pathname format.</td>
</tr>
<tr>
<td>auto_format</td>
<td>The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format. Recommended practice: For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way.</td>
</tr>
</tbody>
</table>

31.12.8.2 Enum class file_type [fs.enum.file.type]

This enum class specifies constants used to identify file types, with the meanings listed in Table 131. The values of the constants are distinct.

Table 131: Enum class file_type [tab:fs.enum.file.type]

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>The type of the file has not been determined or an error occurred while trying to determine the type.</td>
</tr>
<tr>
<td>not_found</td>
<td>Pseudo-type indicating the file was not found.</td>
</tr>
<tr>
<td>regular</td>
<td>Regular file</td>
</tr>
<tr>
<td>directory</td>
<td>Directory file</td>
</tr>
<tr>
<td>symlink</td>
<td>Symbolic link file</td>
</tr>
<tr>
<td>block</td>
<td>Block special file</td>
</tr>
<tr>
<td>character</td>
<td>Character special file</td>
</tr>
<tr>
<td>fifo</td>
<td>FIFO or pipe file</td>
</tr>
<tr>
<td>socket</td>
<td>Socket file</td>
</tr>
<tr>
<td>implementation-defined</td>
<td>Implementations that support file systems having file types in addition to the above file_type types shall supply implementation-defined file_type constants to separately identify each of those additional file types</td>
</tr>
<tr>
<td>unknown</td>
<td>The file exists but the type cannot be determined</td>
</tr>
</tbody>
</table>

31.12.8.3 Enum class copy_options [fs.enum.copy.opts]

The enum class type copy_options is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 132. The constant none represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.
### Table 132: Enum class `copy_options`  
[tab:fs.enum.copy.opts]

<table>
<thead>
<tr>
<th>Option group controlling <code>copy_file</code> function effects for existing target files</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

§ 31.12.8.3
31.12.8.4 Enum class perms

The enum class type perms is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 133.

31.12.8.5 Enum class perm_options

The enum class type perm_options is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 134. The bitmask constants are bitmask elements. In Table 134 perm denotes a value of type perms passed to permissions.

<td>permissions shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.</td>
</tr>
</tbody>
</table>

31.12.8.6 Enum class directory_options

The enum class type directory_options is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 135. The constant none represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

31.12.9 Class file_status

31.12.9.1 General

namespace std::filesystem {

  class file_status {

    public:
      // 31.12.9.2, constructors and destructor
      file_status() noexcept : file_status(file_type::none) {} 
      explicit file_status(file_type ft, 
                            perms prms = perms::unknown) noexcept; 
      file_status(const file_status&) noexcept = default; 
      file_status(file_status&&) noexcept = default; 
      ~file_status(); 

      // assignments
      file_status& operator=(const file_status&) noexcept = default; 
      file_status& operator=(file_status&&) noexcept = default; 

      // 31.12.9.4, modifiers
      void type(file_type ft) noexcept; 
      void permissions(perms prms) noexcept; 

  } // class file_status

} // namespace std::filesystem

§ 31.12.9.1
An object of type `file_status` stores information about the type and permissions of a file.

### 31.12.9.2 Constructors

```cpp
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

Postconditions: `type() == ft` and `permissions() == prms`.

### 31.12.9.3 Observers

```cpp
file_type type() const noexcept;
```

Returns: The value of `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.

```cpp
perms permissions() const noexcept;
```

Returns: The value of `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

### 31.12.9.4 Modifiers

```cpp
void type(file_type ft) noexcept;
```

Postconditions: `type() == ft`.

```cpp
void permissions(perms prms) noexcept;
```

Postconditions: `permissions() == prms`.

### 31.12.10 Class directory_entry

#### 31.12.10.1 General

```cpp
namespace std::filesystem {
    class directory_entry {
        public:
            // 31.12.10.2, constructors and destructor
            directory_entry() noexcept = default;
            directory_entry(const directory_entry&) = default;
            directory_entry(directory_entry&&) noexcept = default;
            explicit directory_entry(const filesystem::path& p);
            directory_entry(const filesystem::path& p, error_code& ec);
            ~directory_entry();

            // assignments
            directory_entry& operator=(const directory_entry&)
                = default;
            directory_entry& operator=(directory_entry&&) noexcept
                = default;

            // 31.12.10.3, modifiers
            void assign(const filesystem::path& p);
            void assign(const filesystem::path& p, error_code& ec);
            void replace_filename(const filesystem::path& p);
            void replace_filename(const filesystem::path& p, error_code& ec);
            void refresh();
            void refresh(error_code& ec) noexcept;

            // 31.12.10.4, observers
            const filesystem::path& path() const noexcept;
            operator const filesystem::path&() const noexcept;
            bool exists() const;
    }
}
```
bool exists(error_code& ec) const noexcept;
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
bool is_other() const;
bool is_other(error_code& ec) const noexcept;
bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
file_status status() const;
file_status status(error_code& ec) const noexcept;
file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;
bool operator==(const directory_entry& rhs) const noexcept;
strong_ordering operator<=>(const directory_entry& rhs) const noexcept;

// 31.12.10.5, inserter
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);

private:
filesystem::path pathobject; // exposition only
friend class directory_iterator; // exposition only
};

A directory_entry object stores a path object and may store additional objects for file attributes such as
hard link count, status, symlink status, file size, and last write time.

Implementations should store such additional file attributes during directory iteration if their values are avail-
able and storing the values would allow the implementation to eliminate file system accesses by directory_-
entry observer functions (31.12.13). Such stored file attribute values are said to be cached.

[Note 1: For purposes of exposition, class directory_iterator (31.12.11) is shown above as a friend of class
directory_entry. Friendship allows the directory_iterator implementation to cache already available attribute
values directly into a directory_entry object without the cost of an unneeded call to refresh(). — end note]

[Example 1:
using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto& x : directory_iterator("."))
{
    std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto& x : directory_iterator("."))
{
lengthy_function(x.path());  // cache becomes stale
x.refresh();
std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the `std::filesystem::last_write_time` function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the `std::filesystem::last_write_time` function. The code is portable to any implementation, regardless of whether or not it employs caching. — end example

### 31.12.10.2 Constructors

```cpp
explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);
```

1. **Effects**: Calls `refresh()` or `refresh(ec)`, respectively.
2. **Postconditions**: `path()==p` if no error occurs, otherwise `path()==filesystem::path()`.
3. **Throws**: As specified in 31.12.5.

### 31.12.10.3 Modifiers

```cpp
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
```

1. **Effects**: Equivalent to `pathobject=p`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.
2. **Throws**: As specified in 31.12.5.

```cpp
void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);
```

3. **Effects**: Equivalent to `pathobject.replace_filename(p)`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.
4. **Throws**: As specified in 31.12.5.

```cpp
void refresh();
void refresh(error_code& ec) noexcept;
```

5. **Effects**: Stores the current values of any cached attributes of the file `p` resolves to. If an error occurs, an error is reported (31.12.5) and the values of any cached attributes are unspecified.
6. **Throws**: As specified in 31.12.5.

### 31.12.10.4 Observers

Unqualified function names in the `Returns` elements of the `directory_entry` observers described below refer to members of the `std::filesystem` namespace.

```cpp
const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;
```

1. **Returns**: `pathobject`.

```cpp
bool exists() const;
bool exists(error_code& ec) const noexcept;
```

3. **Returns**: `exists(this->status())` or `exists(this->status(ec))`, respectively.
4. **Throws**: As specified in 31.12.5.

```cpp
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
```

5. **Returns**: `is_block_file(this->status())` or `is_block_file(this->status(ec))`, respectively.
6. **Throws**: As specified in 31.12.5.

§ 31.12.10.4 1766
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;

Returns: is_character_file(this->status()) or is_character_file(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;

Returns: is_directory(this->status()) or is_directory(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;

Returns: is_fifo(this->status()) or is_fifo(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_other() const;
bool is_other(error_code& ec) const noexcept;

Returns: is_other(this->status()) or is_other(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;

Returns: is_regular_file(this->status()) or is_regular_file(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;

Returns: is_socket(this->status()) or is_socket(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;

Returns: is_symlink(this->symlink_status()) or is_symlink(this->symlink_status(ec)), respectively.

Throws: As specified in 31.12.5.

uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;

Returns: If cached, the file size attribute value. Otherwise, file_size(path()) or file_size(path(), ec), respectively.

Throws: As specified in 31.12.5.

uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;

Returns: If cached, the hard link count attribute value. Otherwise, hard_link_count(path()) or hard_link_count(path(), ec), respectively.

Throws: As specified in 31.12.5.

file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;

Returns: If cached, the last write time attribute value. Otherwise, last_write_time(path()) or last_write_time(path(), ec), respectively.

Throws: As specified in 31.12.5.
file_status status() const;
file_status status(error_code& ec) const noexcept;

Returns: If cached, the status attribute value. Otherwise, status(path()) or status(path(), ec), respectively.

Throws: As specified in 31.12.5.

file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;

Returns: If cached, the symlink status attribute value. Otherwise, symlink_status(path()) or symlink_status(path(), ec), respectively.

Throws: As specified in 31.12.5.

bool operator==(const directory_entry& rhs) const noexcept;

Returns: pathobject == rhs.pathobject.

strong_ordering operator<=>(const directory_entry& rhs) const noexcept;

Returns: pathobject <=> rhs.pathobject.

31.12.10.5 Inserter

template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);

Effects: Equivalent to: return os << d.path();

31.12.11 Class directory_iterator

An object of type directory_iterator provides an iterator for a sequence of directory_entry elements representing the path and any cached attribute values (31.12.10) for each file in a directory or in an implementation-defined directory-like file type.

[Note 1: For iteration into subdirectories, see class recursive_directory_iterator (31.12.12). — end note]

namespace std::filesystem {
    class directory_iterator {
        public:
            using iterator_category = input_iterator_tag;
            using value_type = directory_entry;
            using difference_type = ptrdiff_t;
            using pointer = const directory_entry*;
            using reference = const directory_entry&;

            // 31.12.11.2, member functions
            directory_iterator() noexcept;
            explicit directory_iterator(const path& p);
            directory_iterator(const path& p, directory_options options);
            directory_iterator(const path& p, error_code& ec);
            directory_iterator(const path& p, directory_options options,
                                error_code& ec);
            directory_iterator(const directory_iterator& rhs);
            directory_iterator(directory_iterator&& rhs) noexcept;
            ~directory_iterator();

            directory_iterator& operator=(const directory_iterator& rhs);
            directory_iterator& operator=(directory_iterator&& rhs) noexcept;

            const directory_entry& operator*() const;
            const directory_entry* operator->() const;
            directory_iterator& operator++();
            directory_iterator& increment(error_code& ec);
            
§ 31.12.11.1 1768
bool operator==(default_sentinel_t) const noexcept {
    return *this == directory_iterator();
}

// other members as required by 25.3.5.3, input iterators

directory_iterator meets the Cpp17InputIterator requirements (25.3.5.3).

If an iterator of type directory_iterator reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The directory_iterator default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.

The end iterator is not dereferenceable.

Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

The result of calling the path() member of the directory_entry object obtained by dereferencing a directory_iterator is a reference to a path object composed of the directory argument from which the iterator was constructed with the filename of the directory entry appended as if by operator/=

Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.

The order of directory entries obtained by dereferencing successive increments of a directory_iterator is unspecified.

Constructors and non-const directory_iterator member functions store the values of any cached attributes (31.12.10) in the directory_entry element returned by operator*(). directory_iterator member functions shall not directly or indirectly call any directory_entry refresh function.

[Note 2: The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class directory_iterator is shown in 31.12.10 as a friend of class directory_entry. — end note]

[Note 3: A path obtained by dereferencing a directory iterator might not actually exist; it could be a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries might invalidate symbolic links that are being followed. — end note]

[Note 4: If a file is removed from or added to a directory after the construction of a directory_iterator for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX readdir. — end note]

### 31.12.11.2 Members [fs.dir.itr.members]

directory_iterator() noexcept;

**Effects:** Constructs the end iterator.

explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);

**Effects:** For the directory that p resolves to, constructs an iterator for the first element in a sequence of directory_entry elements representing the files in the directory, if any; otherwise the end iterator. However, if

(options & directory_options::skip_permission_denied) != directory_options::none

and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

**Throws:** As specified in 31.12.5.

[Note 1: To iterate over the current directory, use directory_iterator(".") rather than directory_iterator(""). — end note]

directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;

**Postconditions:** *this has the original value of rhs.

§ 31.12.11.2 1769
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions: *this has the original value of rhs.

Returns: *this.

directory_iterator operator++();
directory_iterator increment(error_code& ec);

Effects: As specified for the prefix increment operation of Input iterators (25.3.5.3).

Returns: *this.

Throws: As specified in 31.12.5.

31.12.11.3 Non-member functions

These functions enable range access for directory_iterator.

directory_iterator begin(directory_iterator iter) noexcept;

Returns: iter.

directory_iterator end(directory_iterator) noexcept;

Returns: directory_iterator().

31.12.12 Class recursive_directory_iterator

An object of type recursive_directory_iterator provides an iterator for a sequence of directory_entry elements representing the files in a directory or in an implementation-defined directory-like file type, and its subdirectories.

namespace std::filesystem {

class recursive_directory_iterator {

public:

using iterator_category = input_iterator_tag;
using value_type = directory_entry;
using difference_type = ptrdiff_t;
using pointer = const directory_entry*;
using reference = const directory_entry&;

// 31.12.12.2, constructors and destructor
recursive_directory_iterator() noexcept;
explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options,
    error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);
recursive_directory_iterator(const recursive_directory_iterator& rhs);
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
~recursive_directory_iterator();

// 31.12.12.2, observers
directory_options options() const;
int depth() const;
bool recursion_pending() const;

const directory_entry& operator*() const;
const directory_entry* operator->() const;

// 31.12.12.2, modifiers
recursive_directory_iterator&
    operator=(const recursive_directory_iterator& rhs);
recursive_directory_iterator&
    operator=(recursive_directory_iterator&& rhs) noexcept;

§ 31.12.12.1
recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);

void pop();
void pop(error_code& ec); 
void disable_recursion_pending();

bool operator==(default_sentinel_t) const noexcept {
    return *this == recursive_directory_iterator();
}

// other members as required by 25.3.5.3, input iterators

2 Calling options, depth, recursion_pending, pop or disable_recursion_pending on an iterator that is not dereferenceable results in undefined behavior.

3 The behavior of a recursive_directory_iterator is the same as a directory_iterator unless otherwise specified.

4 [Note 1: If the directory structure being iterated over contains cycles then it is possible that the end iterator is unreachable. —end note]

31.12.12.2 Members [fs.rec.dir.itr.members]

recursive_directory_iterator() noexcept;

1 Effects: Constructs the end iterator.

explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);

2 Effects: Constructs an iterator representing the first entry in the directory to which p resolves, if any; otherwise, the end iterator. However, if

   (options & directory_options::skip_permission_denied) != directory_options::none

and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

3 Postconditions: options() == options for the signatures with a directory_options argument, otherwise options() == directory_options::none.

4 Throws: As specified in 31.12.5.

5 [Note 1: Use recursive_directory_iterator("") rather than recursive_directory_iterator("") to iterate over the current directory. —end note]

6 [Note 2: By default, recursive_directory_iterator does not follow directory symlinks. To follow directory symlinks, specify options as directory_options::follow_directory_symlink. —end note]

recursive_directory_iterator(const recursive_directory_iterator& rhs);

7 Postconditions:

   (7.1) options() == rhs.options()
   (7.2) depth() == rhs.depth()
   (7.3) recursion_pending() == rhs.recursion_pending()

recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;

8 Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.

recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);

9 Effects: If *this and rhs are the same object, the member has no effect.

10 Postconditions:
— options() == rhs.options()
— depth() == rhs.depth()
— recursion_pending() == rhs.recursion_pending()

11 Returns: *this.

recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;

12 Effects: If *this and rhs are the same object, the member has no effect.
13 Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(),
14 rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.
15 Returns: *this.

directory_options options() const;

16 Returns: The value of the argument passed to the constructor for the options parameter, if present,
17 otherwise directory_options::none.
18 Throws: Nothing.

int depth() const;

19 Returns: The current depth of the directory tree being traversed.
20 [Note 3: The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. — end note]
21 Throws: Nothing.

bool recursion_pending() const;

22 Returns: true if disable_recursion_pending() has not been called subsequent to the prior construc-
23 tion or increment operation, otherwise false.
24 Throws: Nothing.

recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);

25 Effects: As specified for the prefix increment operation of Input iterators (25.3.5.3), except that:
26 — If there are no more entries at the current depth, then if depth() != 0 iteration over the parent
27 directory resumes; otherwise *this = recursive_directory_iterator().
28 — Otherwise if
29 recursion_pending() && is_directory((*this)->status()) &&
30 (is_symlink((*this)->symlink_status()) ||
31 (options() & directory_options::follow_directory_symlink) != directory_options::none)
then either directory (*this)->path() is recursively iterated into or, if
32 (options() & directory_options::skip_permission_denied) != directory_options::none
33 and an error occurs indicating that permission to access directory (*this)->path() is denied,
34 then directory (*this)->path() is treated as an empty directory and no error is reported.
35 Returns: *this.
36 Throws: As specified in 31.12.5.

27 void pop();
28 void pop(error_code& ec);
29 Effects: If depth() == 0, set *this to recursive_directory_iterator(). Otherwise, cease iteration
30 of the directory currently being iterated over, and continue iteration over the parent directory.
31 Throws: As specified in 31.12.5.
32 Remarks: Any copies of the previous value of *this are no longer required to be dereferenceable nor to be in
33 the domain of ==.

33 void disable_recursion_pending();
34 Postconditions: recursion_pending() == false.
31.12.12.3 Non-member functions

These functions enable use of `recursive_directory_iterator` with range-based `for` statements.

```cpp
recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;
```

`Returns:` `iter`.

```cpp
recursive_directory_iterator end(recursive_directory_iterator) noexcept;
```

`Returns:` `recursive_directory_iterator()`.

31.12.13 Filesystem operation functions

1. Filesystem operation functions query or modify files, including directories, in external storage.

2. `[Note 1]: Because hardware failures, network failures, file system races (31.12.2.4), and many other kinds of errors occur frequently in file system operations, any filesystem operation function, no matter how apparently innocuous, can encounter an error; see 31.12.5. — end note]

31.12.13.2 Absolute

```cpp
path filesystem::absolute(const path& p);
path filesystem::absolute(const path& p, error_code& ec);
```

`Effects:` Composes an absolute path referencing the same file system location as `p` according to the operating system (31.12.2.3).

`Returns:` The composed path. The signature with argument `ec` returns `path()` if an error occurs.

`[Note 1]: For the returned path, `rp, rp.is_absolute()` is `true` unless an error occurs. — end note]

`Throws:` As specified in 31.12.5.

`[Note 2]: To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such as hard disks, consider `canonical` (31.12.13.3). — end note]

`[Note 3]: Implementations are strongly encouraged to not query secondary storage, and not consider `!exists(p)` an error. — end note]

`[Example 1]: For POSIX-based operating systems, `absolute(p)` is simply `current_path()/p`. For Windows-based operating systems, `absolute` might have the same semantics as `GetFullPathNameW`. — end example]

31.12.13.3 Canonical

```cpp
path filesystem::canonical(const path& p);
path filesystem::canonical(const path& p, error_code& ec);
```

`Effects:` Converts `p` to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.

`Returns:` A path that refers to the same file system object as `absolute(p)`. The signature with argument `ec` returns `path()` if an error occurs.

`Throws:` As specified in 31.12.5.

`Remarks:` `!exists(p)` is an error.

31.12.13.4 Copy

```cpp
void filesystem::copy(const path& from, const path& to);
```

`Effects:` Equivalent to `copy(from, to, copy_options::none)`.

```cpp
void filesystem::copy(const path& from, const path& to, error_code& ec);
```

`Effects:` Equivalent to `copy(from, to, copy_options::none, ec)`.

```cpp
void filesystem::copy(const path& from, const path& to, copy_options options);
void filesystem::copy(const path& from, const path& to, copy_options options, error_code& ec);
```

`Preconditions:` At most one element from each option group (31.12.8.3) is set in `options`. 

Effects: Before the first use of f and t:

4.1 If

(options & copy_options::create_symlinks) != copy_options::none ||
(options & copy_options::skip_symlinks) != copy_options::none

then auto f = symlink_status(from) and if needed auto t = symlink_status(to).

4.2 Otherwise, if

(options & copy_options::copy_symlinks) != copy_options::none

then auto f = symlink_status(from) and if needed auto t = status(to).

4.3 Otherwise, auto f = status(from) and if needed auto t = status(to).

Effects are then as follows:

4.4 If f.type() or t.type() is an implementation-defined file type (31.12.8.2), then the effects are implementation-defined.

4.5 Otherwise, an error is reported as specified in 31.12.5 if:

4.5.1 exists(f) is false, or
4.5.2 equivalent(from, to) is true, or
4.5.3 is_other(f) || is_other(t) is true, or
4.5.4 is_directory(f) && is_regular_file(t) is true.

4.6 Otherwise, if is_symlink(f), then:

4.6.1 If (options & copy_options::skip_symlinks) != copy_options::none then return.
4.6.2 Otherwise if

!exists(t) && (options & copy_options::copy_symlinks) != copy_options::none
then copy_symlink(from, to).

4.6.3 Otherwise report an error as specified in 31.12.5.

4.7 Otherwise, if is_regular_file(f), then:

4.7.1 If (options & copy_options::directories_only) != copy_options::none, then return.
4.7.2 Otherwise, if (options & copy_options::create_symlinks) != copy_options::none, then create a symbolic link to the source file.
4.7.3 Otherwise, if (options & copy_options::create_hard_links) != copy_options::none, then create a hard link to the source file.
4.7.4 Otherwise, if is_directory(t), then copy_file(from, to/from.filename(), options).
4.7.5 Otherwise, copy_file(from, to, options).

4.8 Otherwise, if

is_directory(f) &&
(options & copy_options::create_symlinks) != copy_options::none

then report an error with an error_code argument equal to make_error_code(errc::is_a_directory).

4.9 Otherwise, if

is_directory(f) &&
(options & copy_options::recursive) != copy_options::none ||
options == copy_options::none

then:

4.9.1 If exists(t) is false, then create_directory(to, from).
4.9.2 Then, iterate over the files in from, as if by

for (const directory_entry& x : directory_iterator(from))
copy(x.path(), to/x.path().filename(),
options | copy_options::in-recursive-copy);
where \texttt{in-recursive-copy} is a bitmask element of \texttt{copy_options} that is not one of the elements in 31.12.8.3.

(4.10) Otherwise, for the signature with argument \texttt{ec}, \texttt{ec.clear()}. (4.11) Otherwise, no effects.

5 \textit{Throws}: As specified in 31.12.5.

6 \textit{Remarks}: For the signature with argument \texttt{ec}, any library functions called by the implementation shall have an \texttt{error_code} argument if applicable.

7 [\textit{Example 1}]: Given this directory structure:

\begin{verbatim}
/dir1
 file1
 file2
 dir2
 file3

/dir2
 file3

/dir3
 file1
 file2
\end{verbatim}

Calling \texttt{copy("/dir1", "/dir3")} would result in:

\begin{verbatim}
/dir1
 file1
 file2
 dir2
 file3

/dir3
 file1
 file2
\end{verbatim}

Alternatively, calling \texttt{copy("/dir1", "/dir3", \texttt{copy_options::recursive})} would result in:

\begin{verbatim}
/dir1
 file1
 file2
 dir2
 file3

/dir3
 file1
 file2
 dir2
 file3
\end{verbatim}

— end example]

31.12.13.5 Copy file

bool filesystem::copy_file(const path& from, const path& to);
bool filesystem::copy_file(const path& from, const path& to, error_code& ec);

1 Returns: \texttt{copy_file(from, to, \texttt{copy_options::none}) or copy_file(from, to, \texttt{copy_options::none, ec}), respectively.}

2 \textit{Throws}: As specified in 31.12.5.

bool filesystem::copy_file(const path& from, const path& to, \texttt{copy_options options});
bool filesystem::copy_file(const path& from, const path& to, \texttt{copy_options options, error_code& ec});

3 \textit{Preconditions}: At most one element from each option group (31.12.8.3) is set in \texttt{options}.

4 \textit{Effects}: As follows:

(4.1) Report an error as specified in 31.12.5 if:

(4.1.1) \texttt{is_regular_file(from)} is \texttt{false}, or

(4.1.2) \texttt{exists(to)} is \texttt{true} and \texttt{is_regular_file(to)} is \texttt{false}, or

(4.1.3) \texttt{exists(to)} is \texttt{true} and \texttt{equivalent(from, to)} is \texttt{true}, or

(4.1.4) \texttt{exists(to)} is \texttt{true} and
(options & (copy_options::skip_existing | copy_options::overwrite_existing | copy_options::update_existing)) == copy_options::none

— Otherwise, copy the contents and attributes of the file from resolves to, to the file to resolves to, if:
  — exists(to) is false, or
  — (options & copy_options::overwrite_existing) != copy_options::none, or
  — (options & copy_options::update_existing) != copy_options::none and from is more recent than to, determined as if by use of the last_write_time function (31.12.13.26).

— Otherwise, no effects.

Returns: true if the from file was copied, otherwise false. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

Complexity: At most one direct or indirect invocation of status(to).

31.12.13.6 Copy symlink [fs.op.copy.symlink]

void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink);
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink, error_code& ec) noexcept;

Effects: Equivalent to function(read_symlink(existing_symlink), new_symlink) or function(read_symlink(existing_symlink, ec), new_symlink, ec), respectively, where in each case function is create_symlink or create_directory_symlink as appropriate.

Throws: As specified in 31.12.5.

31.12.13.7 Create directories [fs.op.create.directories]

bool filesystem::create_directories(const path& p);
bool filesystem::create_directories(const path& p, error_code& ec);

Effects: Calls create_directory() for each element of p that does not exist.

Returns: true if a new directory was created for the directory p resolves to, otherwise false.

Throws: As specified in 31.12.5.

Complexity: $O(n)$ where n is the number of elements of p.

31.12.13.8 Create directory [fs.op.create.directory]

bool filesystem::create_directory(const path& p);
bool filesystem::create_directory(const path& p, error_code& ec) noexcept;

Effects: Creates the directory p resolves to, as if by POSIX mkdir with a second argument of static_cast<int>(perms::all). If mkdir fails because p resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

Returns: true if a new directory was created, otherwise false.

Throws: As specified in 31.12.5.

bool filesystem::create_directory(const path& p, const path& existing_p);
bool filesystem::create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;

Effects: Creates the directory p resolves to, with attributes copied from directory existing_p. The set of attributes copied is operating system dependent. If mkdir fails because p resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

[Note 1: For POSIX-based operating systems, the attributes are those copied by native API stat(existing_p.c_str(), &attributes_stat) followed by mkdir(p.c_str(), attributes_stat.st_mode). For Windows-based operating systems, the attributes are those copied by native API CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0). — end note]
Returns: true if a new directory was created with attributes copied from directory existing_p, otherwise false.

Throws: As specified in 31.12.5.

31.12.13.9 Create directory symlink (fs.op.create.dir.symlk)

void filesystem::create_directory_symlink(const path& to, const path& new_symlink);
void filesystem::create_directory_symlink(const path& to, const path& new_symlink,
error_code& ec) noexcept;

Effects: Establishes the postcondition, as if by POSIX symlink().

Postconditions: new_symlink resolves to a symbolic link file that contains an unspecified representation
of to.

Throws: As specified in 31.12.5.

[Note 1: Some operating systems require symlink creation to identify that the link is to a directory. Thus,
create_symlink() (instead of create_directory_symlink()) cannot be used reliably to create directory
symlinks. —end note]

[Note 2: Some operating systems do not support symbolic links at all or support them only for regular files.
Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system.
—end note]

31.12.13.10 Create hard link (fs.op.create.hard.lk)

void filesystem::create_hard_link(const path& to, const path& new_hard_link);
void filesystem::create_hard_link(const path& to, const path& new_hard_link,
error_code& ec) noexcept;

Effects: Establishes the postcondition, as if by POSIX link().

Postconditions:

(2.1) exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)
(2.2) The contents of the file or directory to resolves to are unchanged.

Throws: As specified in 31.12.5.

[Note 1: Some operating systems do not support hard links at all or support them only for regular files. Some
file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some
file systems limit the number of links per file. —end note]

31.12.13.11 Create symlink (fs.op.create.symlink)

void filesystem::create_symlink(const path& to, const path& new_symlink);
void filesystem::create_symlink(const path& to, const path& new_symlink,
error_code& ec) noexcept;

Effects: Establishes the postcondition, as if by POSIX symlink().

Postconditions: new_symlink resolves to a symbolic link file that contains an unspecified representation
of to.

Throws: As specified in 31.12.5.

[Note 1: Some operating systems do not support symbolic links at all or support them only for regular files. Some
file systems (such as the FAT file system) do not support symbolic links regardless of the operating system.
—end note]

31.12.13.12 Current path (fs.op.current.path)

path filesystem::current_path();
path filesystem::current_path(error_code& ec);

Returns: The absolute path of the current working directory, whose pathname in the native format is
obtained as if by POSIX getcwd(). The signature with argument ec returns path() if an error occurs.

Throws: As specified in 31.12.5.

Remarks: The current working directory is the directory, associated with the process, that is used as
the starting location in pathname resolution for relative paths.
Note 1: The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name. — end note

Note 2: The current path as returned by many operating systems is a dangerous global variable and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note

```cpp
void filesystem::current_path(const path& p);
void filesystem::current_path(const path& p, error_code& ec) noexcept;
```

Effects: Establishes the postcondition, as if by POSIX `chdir()`.

Postconditions: `equivalent(p, current_path())`.

Throws: As specified in 31.12.5.

Note 3: The current path for many operating systems is a dangerous global state and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note

### 31.12.13 Equivalent

```cpp
bool filesystem::equivalent(const path& p1, const path& p2);
bool filesystem::equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.

Note 1: On POSIX platforms, this is determined as if by the values of the POSIX `stat` class, obtained as if by `stat()` for the two paths, having equal `st_dev` values and equal `st_ino` values. — end note

Returns: `true`, if `p1` and `p2` resolve to the same file system entity, otherwise `false`. The signature with argument `ec` returns false if an error occurs.

Throws: As specified in 31.12.5.

Remarks: `!exists(p1) || !exists(p2)` is an error.

### 31.12.13.14 Exists

```cpp
bool filesystem::exists(file_status s) noexcept;
bool filesystem::exists(const path& p);
bool filesystem::exists(const path& p, error_code& ec) noexcept;
```

Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.

Effects: The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.

Returns: `exists(s)`.

Throws: As specified in 31.12.5.

### 31.12.13.15 File size

```cpp
uintmax_t filesystem::file_size(const path& p);
uintmax_t filesystem::file_size(const path& p, error_code& ec) noexcept;
```

Effects: If `exists(p)` is `false`, an error is reported (31.12.5).

Returns:

1. If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat()`.
2. Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

Throws: As specified in 31.12.5.

### 31.12.13.16 Hard link count

```cpp
uintmax_t filesystem::hard_link_count(const path& p);
```
uintmax_t filesystem::hard_link_count(const path& p, error_code& ec) noexcept;

1. Returns: The number of hard links for p. The signature with argument ec returns static_cast<uintmax_t>(-1) if an error occurs.

2. Throws: As specified in 31.12.5.

31.12.13.17 Is block file

bool filesystem::is_block_file(file_status s) noexcept;

1. Returns: s.type() == file_type::block.

bool filesystem::is_block_file(const path& p);
bool filesystem::is_block_file(const path& p, error_code& ec) noexcept;

2. Returns: is_block_file(status(p)) or is_block_file(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

3. Throws: As specified in 31.12.5.

31.12.13.18 Is character file

bool filesystem::is_character_file(file_status s) noexcept;

1. Returns: s.type() == file_type::character.

bool filesystem::is_character_file(const path& p);
bool filesystem::is_character_file(const path& p, error_code& ec) noexcept;

2. Returns: is_character_file(status(p)) or is_character_file(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

3. Throws: As specified in 31.12.5.

31.12.13.19 Is directory

bool filesystem::is_directory(file_status s) noexcept;

1. Returns: s.type() == file_type::directory.

bool filesystem::is_directory(const path& p);
bool filesystem::is_directory(const path& p, error_code& ec) noexcept;

2. Returns: is_directory(status(p)) or is_directory(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

3. Throws: As specified in 31.12.5.

31.12.13.20 Is empty

bool filesystem::is_empty(const path& p);
bool filesystem::is_empty(const path& p, error_code& ec);

1. Effects:

(1.1) — Determine file_status s, as if by status(p) or status(p, ec), respectively.
(1.2) — For the signature with argument ec, return false if an error occurred.
(1.3) — Otherwise, if is_directory(s):
  (1.3.1) — Create a variable itr, as if by directory_iterator itr(p) or directory_iterator itr(p, ec), respectively.
  (1.3.2) — For the signature with argument ec, return false if an error occurred.
  (1.3.3) — Otherwise, return itr == directory_iterator().
(1.4) — Otherwise:
  (1.4.1) — Determine uintmax_t sz, as if by file_size(p) or file_size(p, ec), respectively.
  (1.4.2) — For the signature with argument ec, return false if an error occurred.
  (1.4.3) — Otherwise, return sz == 0.

2. Throws: As specified in 31.12.5.
31.12.13.21 Is fifo

\begin{verbatim}
bool filesystem::is_fifo(file_status s) noexcept;
\end{verbatim}

Returns: \( s\.type() == \text{file_type::fifo} \).

\begin{verbatim}
bool filesystem::is_fifo(const path& p);
bool filesystem::is_fifo(const path& p, error_code& ec) noexcept;
\end{verbatim}

Returns: \( \text{is_fifo(status(p)) or is_fifo(status(p, ec))} \), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.22 Is other

\begin{verbatim}
bool filesystem::is_other(file_status s) noexcept;
\end{verbatim}

Returns: \( \exists(s) \&\& \!\text{is_regular_file}(s) \&\& \!\text{is_directory}(s) \&\& \!\text{is_symlink}(s) \).

\begin{verbatim}
bool filesystem::is_other(const path& p);
bool filesystem::is_other(const path& p, error_code& ec) noexcept;
\end{verbatim}

Returns: \( \text{is_other(status(p)) or is_other(status(p, ec))} \), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.23 Is regular file

\begin{verbatim}
bool filesystem::is_regular_file(file_status s) noexcept;
\end{verbatim}

Returns: \( s\.type() == \text{file_type::regular} \).

\begin{verbatim}
bool filesystem::is_regular_file(const path& p);
\end{verbatim}

Returns: \( \text{is_regular_file(status(p))} \).

Throws: filesystem_error if status(p) would throw filesystem_error.

\begin{verbatim}
bool filesystem::is_regular_file(const path& p, error_code& ec) noexcept;
\end{verbatim}

Effects: Sets ec as if by status(p, ec).

[Note 1: file_type::none, file_type::not_found and file_type::unknown cases set ec to error values. To distinguish between cases, call the status function directly. —end note]

Returns: \( \text{is_regular_file(status(p, ec))} \). Returns false if an error occurs.

31.12.13.24 Is socket

\begin{verbatim}
bool filesystem::is_socket(file_status s) noexcept;
\end{verbatim}

Returns: \( s\.type() == \text{file_type::socket} \).

\begin{verbatim}
bool filesystem::is_socket(const path& p);
\end{verbatim}

Returns: \( \text{is_socket(status(p)) or is_socket(status(p, ec))} \), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.25 Is symlink

\begin{verbatim}
bool filesystem::is_symlink(file_status s) noexcept;
\end{verbatim}

Returns: \( s\.type() == \text{file_type::symlink} \).

\begin{verbatim}
bool filesystem::is_symlink(const path& p);
\end{verbatim}

Returns: \( \text{is_symlink(symlink_status(p)) or is_symlink(symlink_status(p, ec))} \), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.
31.12.13.26  Last write time

\[
\text{file\_time\_type filesystem::last\_write\_time(const path\& p);} \\
\text{file\_time\_type filesystem::last\_write\_time(const path\& p, error\_code\& ec) noexcept;}
\]

1 Returns: The time of last data modification of p, determined as if by the value of the POSIX \texttt{stat} class member \texttt{st\_mtime} obtained as if by POSIX \texttt{stat()}. The signature with argument \texttt{ec} returns \text{file\_time\_type::min()} if an error occurs.

2 Throws: As specified in 31.12.5.

\[
\text{void filesystem::last\_write\_time(const path\& p, file\_time\_type new\_time);} \\
\text{void filesystem::last\_write\_time(const path\& p, file\_time\_type new\_time,}
\text{ error\_code\& ec) noexcept;}
\]

3 Effects: Sets the time of last data modification of the file resolved to by p to \texttt{new\_time}, as if by POSIX \texttt{futimens()}.

4 Throws: As specified in 31.12.5.

\text{[Note 1: A postcondition of last\_write\_time(p) == new\_time is not specified because it does not necessarily hold for file systems with coarse time granularity. —end note]}

31.12.13.27  Permissions

\[
\text{void filesystem::permissions(const path\& p, perms prms, perm\_options opts=perm\_options::replace);} \\
\text{void filesystem::permissions(const path\& p, perms prms, error\_code\& ec) noexcept;} \\
\text{void filesystem::permissions(const path\& p, perms prms, perm\_options opts, error\_code\& ec);} \\
\]

1 Preconditions: Exactly one of the \texttt{perm\_options} constants \texttt{replace}, \texttt{add}, or \texttt{remove} is present in \texttt{opts}.

2 Effects: Applies the action specified by \texttt{opts} to the file p resolves to, or to file p itself if p is a symbolic link and \texttt{perm\_options::nofollow} is set in \texttt{opts}. The action is applied as if by POSIX \texttt{fchmodat()}. 

3 \text{[Note 1: Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism. —end note]}

4 Throws: As specified in 31.12.5.

5 Remarks: The second signature behaves as if it had an additional parameter \texttt{perm\_options opts} with an argument of \texttt{perm\_options::replace}.

31.12.13.28  Proximate

\[
\text{path filesystem::proximate(const path\& p, error\_code\& ec);} \\
\text{path filesystem::proximate(const path\& p, const path\& base = current\_path());} \\
\text{path filesystem::proximate(const path\& p, const path\& base, error\_code\& ec);} \\
\]

1 Returns: \texttt{proximate(p, current\_path(), ec)}.

2 Throws: As specified in 31.12.5.

3 Returns: For the first form:

\[
\text{weakly\_canonical(p).lexically\_proximate(weakly\_canonical(base))};
\]

For the second form:

\[
\text{weakly\_canonical(p, ec).lexically\_proximate(weakly\_canonical(base, ec))};
\]

or \texttt{path()} at the first error occurrence, if any.

4 Throws: As specified in 31.12.5.

31.12.13.29  Read symlink

\[
\text{path filesystem::read\_symlink(const path\& p);} \\
\text{path filesystem::read\_symlink(const path\& p, error\_code\& ec);} \\
\]

1 Returns: If p resolves to a symbolic link, a \texttt{path} object containing the contents of that symbolic link. The signature with argument \texttt{ec} returns \texttt{path()} if an error occurs.

2 Throws: As specified in 31.12.5.

\text{[Note 1: It is an error if p does not resolve to a symbolic link. —end note]}

§ 31.12.13.29 1781
31.12.13.30 Relative

path filesystem::relative(const path& p, error_code& ec);

Returns: relative(p, current_path(), ec).

Throws: As specified in 31.12.5.

path filesystem::relative(const path& p, const path& base = current_path());

Returns: For the first form:
weakly_canonical(p).lexically_relative(weakly_canonical(base));

For the second form:
weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
or path() at the first error occurrence, if any.

Throws: As specified in 31.12.5.

31.12.13.31 Remove

bool filesystem::remove(const path& p);
bool filesystem::remove(const path& p, error_code& ec) noexcept;

Effects: If exists(symlink_status(p, ec)), the file p is removed as if by POSIX remove().

[Note 1: A symbolic link is itself removed, rather than the file it resolves to. — end note]

Postconditions: exists(symlink_status(p)) is false.

Returns: false if p did not exist, otherwise true. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.32 Remove all

uintmax_t filesystem::remove_all(const path& p);
uintmax_t filesystem::remove_all(const path& p, error_code& ec);

Effects: Recursively deletes the contents of p if it exists, then deletes file p itself, as if by POSIX remove().

[Note 1: A symbolic link is itself removed, rather than the file it resolves to. — end note]

Postconditions: exists(symlink_status(p)) is false.

Returns: The number of files removed. The signature with argument ec returns static_cast<uintmax_t>(-1) if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.33 Rename

void filesystem::rename(const path& old_p, const path& new_p);
void filesystem::rename(const path& old_p, const path& new_p, error_code& ec) noexcept;

Effects: Renames old_p to new_p, as if by POSIX rename().

[Note 1:]
(1.1) — If old_p and new_p resolve to the same existing file, no action is taken.
(1.2) — Otherwise, the rename can include the following effects:
(1.2.1) — if new_p resolves to an existing non-directory file, new_p is removed; otherwise.
(1.2.2) — if new_p resolves to an existing directory, new_p is removed if empty on POSIX compliant operating systems but might be an error on other operating systems.

A symbolic link is itself renamed, rather than the file it resolves to. — end note]

Throws: As specified in 31.12.5.
31.12.13.34 Resize file

void filesystem::resize_file(const path& p, uintmax_t new_size);
void filesystem::resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;

Effects: Causes the size that would be returned by file_size(p) to be equal to new_size, as if by POSIX truncate().

Throws: As specified in 31.12.5.

31.12.13.35 Space

space_info filesystem::space(const path& p);
space_info filesystem::space(const path& p, error_code& ec) noexcept;

Returns: An object of type space_info. The value of the space_info object is determined as if by using POSIX statvfs to obtain a POSIX struct statvfs, and then multiplying its f_blocks, f_bfree, and f_bavail members by its f_frsize member, and assigning the results to the capacity, free, and available members respectively. Any members for which the value cannot be determined shall be set to static_cast<uintmax_t>(-1). For the signature with argument ec, all members are set to static_cast<uintmax_t>(-1) if an error occurs.

Throws: As specified in 31.12.5.

Remarks: The value of member space_info::available is operating system dependent.

[Note 1: available might be less than free. — end note]

31.12.13.36 Status

file_status filesystem::status(const path& p);

Effects: As if:

error_code ec;
file_status result = status(p, ec);
if (result.type() == file_type::none)
  throw filesystem_error(implementation-supplied-message, p, ec);
return result;

Returns: See above.

Throws: filesystem_error.

[Note 1: result values of file_status(file_type::not_found) and file_status(file_type::unknown) are not considered failures and do not cause an exception to be thrown. — end note]

file_status filesystem::status(const path& p, error_code& ec) noexcept;

Effects: If possible, determines the attributes of the file p resolves to, as if by using POSIX stat() to obtain a POSIX struct stat. If, during attribute determination, the underlying file system API reports an error, sets ec to indicate the specific error reported. Otherwise, ec.clear().

[Note 2: This allows users to inspect the specifics of underlying API errors even when the value returned by status() is not file_status(file_type::none). — end note]

Let prms denote the result of (m & perms::mask), where m is determined as if by converting the st_mode member of the obtained struct stat to the type perms.

Returns:

(6.1) — If ec != error_code():
  (6.1.1) — If the specific error indicates that p cannot be resolved because some element of the path does not exist, returns file_status(file_type::not_found).
  (6.1.2) — Otherwise, if the specific error indicates that p can be resolved but the attributes cannot be determined, returns file_status(file_type::unknown).
  (6.1.3) — Otherwise, returns file_status(file_type::none).

[Note 3: These semantics distinguish between p being known not to exist, p existing but not being able to determine its attributes, and there being an error that prevents even knowing if p exists. These distinctions are important to some use cases. — end note]
Otherwise,

— If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular, prms)`.

[Note 4: `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory.  — end note]

— Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory, prms)`.

[Note 5: `file_type::directory` implies that calling `directory_iterator(p)` would succeed.  — end note]

— Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block, prms)`.

— Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character, prms)`.

— Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo, prms)`.

— Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket, prms)`.

— Otherwise, if the attributes indicate an implementation-defined file type (31.12.8.2), returns `file_status(file_type::A, prms)`, where `A` is the constant for the implementation-defined file type.

— Otherwise, returns `file_status(file_type::unknown, prms)`.

Remarks: If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

31.12.37 Status known [fs.op.status.known]

```cpp
bool filesystem::status_known(file_status s) noexcept;
```

Returns: `s.type() != file_type::none`.

31.12.38 Symlink status [fs.op.symlink.status]

```cpp
file_status filesystem::symlink_status(const path& p);
file_status filesystem::symlink_status(const path& p, error_code& ec) noexcept;
```

Effects: Same as `status()`, above, except that the attributes of `p` are determined as if by using POSIX `lstat()` to obtain a POSIX `struct stat`.

Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

Returns: Same as `status()`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink, prms)`.

The signature with argument `ec` returns `file_status(file_type::none)` if an error occurs.

Throws: As specified in 31.12.5.

Remarks: Pathname resolution terminates if `p` names a symbolic link.

31.12.39 Temporary directory path [fs.op.temp.dir.path]

```cpp
path filesystem::temp_directory_path();
path filesystem::temp_directory_path(error_code& ec);
```

Let `p` be an unspecified directory path suitable for temporary files.

Effects: If `exists(p)` is `false` or `is_directory(p)` is `false`, an error is reported (31.12.5).

Returns: The path `p`. The signature with argument `ec` returns `path()` if an error occurs.

Throws: As specified in 31.12.5.
Example 1: For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list TMPDIR, TMP, TEMP, TEMPDIR, or if none of these are found, "/tmp".

For Windows-based operating systems, an implementation might return the path reported by the Windows GetTempPath API function. — end example]

31.12.13.40 Weakly canonical

path filesystem::weakly_canonical(const path& p);
path filesystem::weakly_canonical(const path& p, error_code& ec);

Effects: Using status(p) or status(p, ec), respectively, to determine existence, return a path composed by operator/= from the result of calling canonical() with a path argument composed of the leading elements of p that exist, if any, followed by the elements of p that do not exist, if any. For the first form, canonical() is called without an error_code argument. For the second form, canonical() is called with ec as an error_code argument, and path() is returned at the first error occurrence, if any.

Postconditions: The returned path is in normal form (31.12.6.2).

Returns: p with symlinks resolved and the result normalized (31.12.6.2).

Throws: As specified in 31.12.5.

#define SCNoN see below
#define SCNoN see below
The contents and meaning of the header `<cinttypes>` are the same as the C standard library header `<inttypes.h>`, with the following changes:

1. The header `<cinttypes>` includes the header `<cstdint>` (17.4.1) instead of `<stdint.h>`, and
2. `intmax_t` and `uintmax_t` are not required to be able to represent all values of extended integer types wider than `long long` and `unsigned long long`, respectively, and
3. if and only if the type `intmax_t` designates an extended integer type (6.8.2), the following function signatures are added:

```c
constexpr intmax_t abs(intmax_t);
constexpr imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `constexpr intmax_t imaxabs(intmax_t)` and `constexpr imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

See also: ISO C 7.8

Each of the PRI macros listed in this subclause is defined if and only if the implementation defines the corresponding `typedef-name` in 17.4.1. Each of the SCN macros listed in this subclause is defined if and only if the implementation defines the corresponding `typedef-name` in 17.4.1.
if the implementation defines the corresponding \textit{typedef-name} in 17.4.1 and has a suitable \texttt{fscanf} length modifier for the type.
32  Regular expressions library

32.1  General

This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.

The following subclauses describe a basic regular expression class template and its traits that can handle char-like (23.1) template arguments, two specializations of this class template that handle sequences of char and wchar_t, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 136.

32.2  Requirements

This subclause defines requirements on classes representing regular expression traits.

[Note 1: The class template regex_traits, defined in 32.6, meets these requirements. — end note]

The class template basic_regex, defined in 32.7, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by the basic_regex class template. This subclause defines the semantics of these members.

To specialize class template basic_regex for a character container CharT and its related regular expression traits class Traits, use basic_regex<CharT, Traits>.

In the following requirements,

1. X denotes a traits class defining types and functions for the character container type charT;
2. u is an object of type X;
3. v is an object of type const X;
4. p is a value of type const charT*;
5. I1 and I2 are input iterators (25.3.5.3);
6. F1 and F2 are forward iterators (25.3.5.5);
7. c is a value of type const charT;
8. s is an object of type X::string_type;
9. cs is an object of type const X::string_type;
10. b is a value of type bool;
11. I is a value of type int;
12. cl is an object of type X::char_class_type; and
loc is an object of type X::locale_type.

A traits class X meets the regular expression traits requirements if the following types and expressions are well-formed and have the specified semantics.

typename X::char_type
  
  Result: charT, the character container type used in the implementation of class template basic_regex.

typename X::string_type
  
  Result: basic_string<charT>

typename X::locale_type
  
  Result: A copy constructible type that represents the locale used by the traits class.

typename X::char_class_type
  
  Result: A bitmask type (16.3.3.3.3) representing a particular character classification.

X::length(p)
  
  Result: size_t
  
  Returns: The smallest i such that p[i] == 0.
  
  Complexity: Linear in i.

v.translate(c)
  
  Result: X::char_type
  
  Returns: A character such that for any character d that is to be considered equivalent to c then v.translate(c) == v.translate(d).

v.translate_nocase(c)
  
  Result: X::char_type
  
  Returns: For all characters C that are to be considered equivalent to c when comparisons are to be performed without regard to case, then v.translate_nocase(c) == v.translate_nocase(C).

v.transform(F1, F2)
  
  Result: X::string_type
  
  Returns: A sort key for the character sequence designated by the iterator range [F1,F2) such that if the character sequence [G1,G2) sorts before the character sequence [H1,H2) then v.transform(G1, G2) < v.transform(H1, H2).

v.transform_primary(F1, F2)
  
  Result: X::string_type
  
  Returns: A sort key for the character sequence designated by the iterator range [F1,F2) such that if the character sequence [G1,G2) sorts before the character sequence [H1,H2) when character case is not considered then v.transform_primary(G1, G2) < v.transform_primary(H1, H2).

v.lookup_collatename(F1, F2)
  
  Result: X::string_type
  
  Returns: A sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range [F1,F2). Returns an empty string if the character sequence is not a valid collating element.

v.lookup_classname(F1, F2, b)
  
  Result: X::char_class_type
  
  Returns: Converts the character sequence designated by the iterator range [F1,F2) into a value of a bitmask type that can subsequently be passed to isctype. Values returned from lookup_classname can be bitwise OR'ed together; the resulting value represents membership in either of the corresponding character classes. If b is true, the returned bitmask is suitable for matching characters without regard
to their case. Returns 0 if the character sequence is not the name of a character class recognized by X. The value returned shall be independent of the case of the characters in the sequence.

v.isctype(c, cl)

Result: bool

Returns: Returns true if character c is a member of one of the character classes designated by cl, false otherwise.

v.value(c, I)

Result: int

Returns: Returns the value represented by the digit c in base I if the character c is a valid digit in base I; otherwise returns -1.

[Note 2: The value of I will only be 8, 10, or 16. — end note]

u.imbue(loc)

Result: X.locale_type

Effects: Imbues u with the locale loc and returns the previous locale used by u if any.

v.getloc()

Result: X.locale_type

Returns: Returns the current locale used by v, if any.

[Note 3: Class template regex_traits meets the requirements for a regular expression traits class when it is specialized for char or wchar_t. This class template is described in the header <regex>, and is described in 32.6. — end note]

32.3 Header <regex> synopsis

#include <compare>  // see 17.11.1
#include <initializer_list>  // see 17.10.2

}

32.4 Namespace std::regex_constants

32.4.1 General

The namespace std::regex_constants holds symbolic constants used by the regular expression library. This namespace provides three types, syntax_option_type, match_flag_type, and error_type, along with several constants of these types.

32.4.2 Bitmask type syntax_option_type

namespace std::regex_constants {
    using syntax_option_type = T1;
    inline constexpr syntax_option_type icase = unspecified;
    inline constexpr syntax_option_type nosubs = unspecified;
    inline constexpr syntax_option_type optimize = unspecified;
    inline constexpr syntax_option_type collate = unspecified;
    inline constexpr syntax_option_type ECMAScript = unspecified;
    inline constexpr syntax_option_type basic = unspecified;
    inline constexpr syntax_option_type extended = unspecified;
    inline constexpr syntax_option_type awk = unspecified;
    inline constexpr syntax_option_type grep = unspecified;
    inline constexpr syntax_option_type egrep = unspecified;
    inline constexpr syntax_option_type multiline = unspecified;
}

The type syntax_option_type is an implementation-defined bitmask type (16.3.3.3.3). Setting its elements has the effects listed in Table 137. A valid value of type syntax_option_type shall have at most one of the grammar elements ECMAScript, basic, extended, awk, grep, egrep, set. If no grammar element is set, the default grammar is ECMAScript.

32.4.3 Bitmask type match_flag_type

namespace std::regex_constants {
    using match_flag_type = T2;
    inline constexpr match_flag_type match_default = {};
    inline constexpr match_flag_type match_not_bol = unspecified;
    inline constexpr match_flag_type match_not_eol = unspecified;
    inline constexpr match_flag_type match_not_bow = unspecified;
    inline constexpr match_flag_type match_not_eow = unspecified;
    inline constexpr match_flag_type match_any = unspecified;
    inline constexpr match_flag_type match_not_null = unspecified;
    inline constexpr match_flag_type match_continuous = unspecified;
    inline constexpr match_flag_type match_prev_avail = unspecified;
    inline constexpr match_flag_type format_default = {};
    inline constexpr match_flag_type format_sed = unspecified;
    inline constexpr match_flag_type format_no_copy = unspecified;
    inline constexpr match_flag_type format_first_only = unspecified;
}

The type match_flag_type is an implementation-defined bitmask type (16.3.3.3.3). The constants of that type, except for match_default and format_default, are bitmask elements. The match_default and format_default constants are empty bitmasks. Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 138 for any bitmask elements set.

<td>When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.</td>
</tr>
<tr>
<td>format_no_copy</td>
<td>During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.</td>
</tr>
<tr>
<td>format_first_only</td>
<td>When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.</td>
</tr>
</tbody>
</table>

32.4.4 Implementation-defined *error_type*

```cpp
namespace std::regex_constants {
    using error_type = T3;
    inline constexpr error_type error_collate = unspecified;
    inline constexpr error_type error_ctype = unspecified;
    inline constexpr error_type error_escape = unspecified;
    inline constexpr error_type error_backref = unspecified;
    inline constexpr error_type error_brack = unspecified;
    inline constexpr error_type error_paren = unspecified;
    inline constexpr error_type error_brace = unspecified;
    inline constexpr error_type error_badbrace = unspecified;
    inline constexpr error_type error_range = unspecified;
    inline constexpr error_type error_space = unspecified;
    inline constexpr error_type error_badrepeat = unspecified;
    inline constexpr error_type error_complexity = unspecified;
    inline constexpr error_type error_stack = unspecified;
}
```

1 The type *error_type* is an implementation-defined enumerated type (16.3.3.3.2). Values of type *error_type* represent the error conditions described in Table 139:

Table 139: *error_type* values in the C locale  

<table>
<thead>
<tr>
<th>Value</th>
<th>Error condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_collate</td>
<td>The expression contains an invalid collating element name.</td>
</tr>
<tr>
<td>error_ctype</td>
<td>The expression contains an invalid character class name.</td>
</tr>
<tr>
<td>error_escape</td>
<td>The expression contains an invalid escaped character, or a trailing escape.</td>
</tr>
<tr>
<td>error_backref</td>
<td>The expression contains an invalid back reference.</td>
</tr>
<tr>
<td>error_brack</td>
<td>The expression contains mismatched [ and ].</td>
</tr>
<tr>
<td>error_paren</td>
<td>The expression contains mismatched ( and ).</td>
</tr>
<tr>
<td>error_brace</td>
<td>The expression contains mismatched { and }.</td>
</tr>
<tr>
<td>error_badbrace</td>
<td>The expression contains an invalid range in a { expression.</td>
</tr>
<tr>
<td>error_range</td>
<td>The expression contains an invalid character range, such as [b-a] in most encodings.</td>
</tr>
<tr>
<td>error_space</td>
<td>There is insufficient memory to convert the expression into a finite state machine.</td>
</tr>
<tr>
<td>error_badrepeat</td>
<td>One of *?+{ is not preceded by a valid regular expression.</td>
</tr>
<tr>
<td>error_complexity</td>
<td>The complexity of an attempted match against a regular expression exceeds a pre-set level.</td>
</tr>
<tr>
<td>error_stack</td>
<td>There is insufficient memory to determine whether the regular expression matches the specified character sequence.</td>
</tr>
</tbody>
</table>

32.5 Class *regex_error*  

```cpp
namespace std {
    class regex_error : public runtime_error {
        public:
            explicit regex_error(regex_constants::error_type ecode);
            regex_constants::error_type code() const;
    }
}
```
class regex_error defines the type of objects thrown as exceptions to report errors from the regular expression library.

```cpp
regex_error(regex_constants::error_type ecode);
```

**Postconditions:** ecode == code().

```cpp
regex_constants::error_type code() const;
```

**Returns:** The error code that was passed to the constructor.

### 32.6 Class template regex_traits

```cpp
namespace std {
    template<class charT>
    struct regex_traits {
        using char_type = charT;
        using string_type = basic_string<char_type>;
        using locale_type = locale;
        using char_class_type = bitmask_type;
        regex_traits();
        static size_t length(const char_type* p);
        charT translate(charT c) const;
        charT translate_nocase(charT c) const;
        template<class ForwardIterator>
        string_type transform(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        char_class_type lookup_classname(ForwardIterator first, ForwardIterator last, bool icase = false) const;
        static int value(charT ch, int radix) const;
        locale_type imbue(locale_type l);
        locale_type getloc() const;
    };
}
```

The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (32.2).

```cpp
using char_class_type = bitmask_type;
```

The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```cpp
static size_t length(const char_type* p);
```

**Returns:** `char_traits<charT>::length(p)`.

```cpp
charT translate(charT c) const;
```

**Returns:** `c`.

```cpp
charT translate_nocase(charT c) const;
```

**Returns:** `use_facet<ctype<charT>>(getloc()).tolower(c)`.

```cpp
template<class ForwardIterator>
string_type transform(ForwardIterator first, ForwardIterator last) const;
```

**Effects:** As if by:
string_type str(first, last);
return use_facet<collate<charT>>(
    getloc()).transform(str.data(), str.data() + str.length());

template<class ForwardIterator>
string_type transform_primary(ForwardIterator first, ForwardIterator last) const;

Effects: If
    typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)
and the form of the sort key returned by collate_byname<charT>::transform(first, last) is
known and can be converted into a primary sort key then returns that key, otherwise returns an empty
string.

template<class ForwardIterator>
string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;

Returns: A sequence of one or more characters that represents the collating element consisting of the
character sequence designated by the iterator range [first, last). Returns an empty string if the
character sequence is not a valid collating element.

template<class ForwardIterator>
char_class_type lookup_classname(ForwardIterator first, ForwardIterator last, bool icase = false) const;

Returns: An unspecified value that represents the character classification named by the character
sequence designated by the iterator range [first, last). If the parameter icase is true then the
returned mask identifies the character classification without regard to the case of the characters being
matched, otherwise it does honor the case of the characters being matched.\footnote{For example, if the parameter icase is \texttt{true} then \texttt{[:lower:]} is the same as \texttt{[:alpha:]}.}
The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized
then returns char_class_type().

Remarks: For \texttt{regex_traits<char>}, at least the narrow character names in Table 140 shall be
recognized. For \texttt{regex_traits<wchar_t>}, at least the wide character names in Table 140 shall be
recognized.

bool isctype(charT c, char_class_type f) const;

Effects: Determines if the character \texttt{c} is a member of the character classification represented by \texttt{f}.

Returns: Given the following function declaration:
    // for exposition only
template<class C>
    ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
that returns a value in which each ctype_base::mask value corresponding to a value in \texttt{f} named in
Table 140 is set, then the result is determined as if by:
    ctype_base::mask m = convert<charT>(f);
    const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
    if (ct.is(m, c)) {
        return true;
    } else if (c == ct.widen('_')) {
        charT w[1] = { ct.widen('w') };
        char_class_type x = lookup_classname(w, w+1);
        return (f&x) == x;
    } else {
        return false;
    }

[Example 1:
    regex_traits<char> t;
    string d("d");
    string u("upper");
    regex_traits<char>::char_class_type f;
    f = t.lookup_classname(d.begin(), d.end());]
```cpp
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper

— end example

[Example 2:

regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f); // returns true
t.isctype('_', f); // returns true
t.isctype(' ', f); // returns false

— end example

int value(charT ch, int radix) const;

Preconditions: The value of radix is 8, 10, or 16.
Returns: The value represented by the digit ch in base radix if the character ch is a valid digit in base radix; otherwise returns -1.

locale_type imbue(locale_type loc);

Effects: Imbues this with a copy of the locale loc.
[Note 1: Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this. — end note]
Postconditions: getloc() == loc.
Returns: If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of *this, otherwise a copy of the last argument passed to imbue.

locale_type getloc() const;

Returns: If no locale has been imbued then a copy of the global locale in effect at the time of construction of *this, otherwise a copy of the last argument passed to imbue.

32.7 Class template basic_regex

32.7.1 General

For a char-like type charT, specializations of class template basic_regex represent regular expressions constructed from character sequences of charT characters. In the rest of 32.7, charT denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class basic_regex.
Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

[Note 1: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this. —end note]

The functions described in 32.7 report errors by throwing exceptions of type `regex_error`.

```cpp
namespace std {
    template<class charT, class traits = regex_traits<charT>>
    class basic_regex {
    public:
        // types
        using value_type = charT;
        using traits_type = traits;
        using string_type = typename traits::string_type;
        using flag_type = regex_constants::syntax_option_type;
        using locale_type = typename traits::locale_type;

        // 32.4.2, constants
        static constexpr flag_type icase = regex_constants::icase;
        static constexpr flag_type nosubs = regex_constants::nosubs;
        static constexpr flag_type optimize = regex_constants::optimize;
        static constexpr flag_type collate = regex_constants::collate;
        static constexpr flag_type ECMAScript = regex_constants::ECMAScript;
        static constexpr flag_type basic = regex_constants::basic;
        static constexpr flag_type extended = regex_constants::extended;
        static constexpr flag_type awk = regex_constants::awk;
        static constexpr flag_type grep = regex_constants::grep;
        static constexpr flag_type egrep = regex_constants::egrep;
        static constexpr flag_type multiline = regex_constants::multiline;

        // 32.7.2, construct/copy/destroy
        basic_regex();
        explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
        basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
        basic_regex(const basic_regex&);
        basic_regex(basic_regex&&) noexcept;
        template<class ST, class SA>
        explicit basic_regex(const basic_string<charT, ST, SA>& s,
            flag_type f = regex_constants::ECMAScript);
        template<class ForwardIterator>
        basic_regex(ForwardIterator first, ForwardIterator last,
            flag_type f = regex_constants::ECMAScript);
        basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);
        ~basic_regex();

        // 32.7.3, assign
        basic_regex& operator=(const basic_regex& e);
        basic_regex& operator=(basic_regex&& e) noexcept;
        basic_regex& operator=(const charT* p);
        basic_regex& operator=(initializer_list<charT> il);
        template<class ST, class SA>
        basic_regex& operator=(const basic_string<charT, ST, SA>& s);
        basic_regex& assign(const basic_regex& e);
        basic_regex& assign(basic_regex&& e) noexcept;
        basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
        basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
        template<class ST, class SA>
        basic_regex& assign(const basic_string<charT, ST, SA>& s,
            flag_type f = regex_constants::ECMAScript);
    }
```
template<class InputIterator>
    basic_regex& assign(InputIterator first, InputIterator last,
    flag_type f = regex_constants::ECMAScript);
    basic_regex& assign(initializer_list<charT>,
    flag_type f = regex_constants::ECMAScript);

// 32.7.4, const operations
    unsigned mark_count() const;
    flag_type flags() const;

// 32.7.5, locale
    locale_type imbue(locale_type loc);
    locale_type getloc() const;

// 32.7.6, swap
    void swap(basic_regex&);
};

template<class ForwardIterator>
    basic_regex(ForwardIterator, ForwardIterator,
    regex_constants::syntax_option_type = regex_constants::ECMAScript)
    -> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;

32.7.2 Constructors

basic_regex();

Postconditions: *this does not match any character sequence.

explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);

Preconditions: C[p, p + char_traits<charT>::length(p)] is a valid range.

Effects: The object’s internal finite state machine is constructed from the regular expression contained
in the sequence of characters C[p, p + char_traits<charT>::length(p)], and interpreted according to
the flags f.

Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
within the expression.

Throws: regex_error if C[p, p + char_traits<charT>::length(p)] is not a valid regular expression.

basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);

Preconditions: C[p, p + len] is a valid range.

Effects: The object’s internal finite state machine is constructed from the regular expression contained
in the sequence of characters C[p, p + len], and interpreted according to the flags specified in f.

Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
within the expression.

Throws: regex_error if C[p, p + len] is not a valid regular expression.

basic_regex(const basic_regex& e);

Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;

Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(),
respectively, had before construction.

template<class ST, class SA>
    explicit basic_regex(const basic_string<charT, ST, SA>& s,
    flag_type f = regex_constants::ECMAScript);

Effects: The object’s internal finite state machine is constructed from the regular expression contained
in the string s, and interpreted according to the flags specified in f.
Postconditions: flags() returns \( f \). mark_count() returns the number of marked sub-expressions within the expression.

Throws: \texttt{regex\_error} if \( s \) is not a valid regular expression.

\[
\text{template<class ForwardIterator> basic_regex(ForwardIterator first, ForwardIterator last, flag_type f = regex\_constants::ECMAScript);}\
\]

Effects: The object’s internal finite state machine is constructed from the regular expression contained in the sequence of characters \([\text{first, last}]\), and interpreted according to the flags specified in \( f \).

Postconditions: flags() returns \( f \). mark_count() returns the number of marked sub-expressions within the expression.

Throws: \texttt{regex\_error} if the sequence \([\text{first, last}]\) is not a valid regular expression.

\[
\text{basic_regex(initializer\_list<charT> il, flag_type f = regex\_constants::ECMAScript);}\
\]

Effects: Same as basic_regex(il.begin(), il.end(), \( f \)).

32.7.3 Assignment

\[
\text{basic_regex& operator=(const basic_regex& e);}\
\]

Postconditions: flags() and mark_count() return \( e.\text{flags()} \) and \( e.\text{mark\_count()} \), respectively.

\[
\text{basic_regex& operator=(basic_regex& e) noexcept;}\
\]

Postconditions: flags() and mark_count() return the values that \( e.\text{flags()} \) and \( e.\text{mark\_count()} \), respectively, had before assignment. \( e \) is in a valid state with unspecified value.

\[
\text{basic_regex& operator=(const charT* p);}\
\]

Effects: Equivalent to: return assign(p);

\[
\text{basic_regex& operator=(initializer\_list<charT> il);}\
\]

Effects: Equivalent to: return assign(il.begin(), il.end());

\[
\text{template<class ST, class SA> basic_regex& operator=(const basic_string<charT, ST, SA>& s);}\
\]

Effects: Equivalent to: return assign(s);

\[
\text{basic_regex& assign(const basic_regex& e);}\
\]

Effects: Equivalent to: return \*this = e;

\[
\text{basic_regex& assign(basic_regex& e) noexcept;}\
\]

Effects: Equivalent to: return \*this = std::move(e);

\[
\text{basic_regex& assign(const charT* p, flag_type f = regex\_constants::ECMAScript);}\
\]

Effects: Equivalent to: return assign(string_type(p), \( f \));

\[
\text{basic_regex& assign(const charT* p, size_t len, flag_type f = regex\_constants::ECMAScript);}\
\]

Effects: Equivalent to: return assign(string_type(p, len), \( f \));

\[
\text{template<class ST, class SA> basic_regex& assign(const basic_string<charT, ST, SA>& s, flag_type f = regex\_constants::ECMAScript);}\
\]

Effects: Assigns the regular expression contained in the string \( s \), interpreted according the flags specified in \( f \). If an exception is thrown, \*this is unchanged.

Postconditions: If no exception is thrown, flags() returns \( f \) and mark_count() returns the number of marked sub-expressions within the expression.

Returns: \*this.

Throws: \texttt{regex\_error} if \( s \) is not a valid regular expression.
template<class InputIterator>
    basic_regex& assign(InputIterator first, InputIterator last,
    flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(string_type(first, last), f);

basic_regex& assign(initializer_list<charT> il,
    flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(il.begin(), il.end(), f);

§ 32.7.4 Constant operations

unsigned mark_count() const;

Effects: Returns the number of marked sub-expressions within the regular expression.

flag_type flags() const;

Effects: Returns a copy of the regular expression syntax flags that were passed to the object’s constructor or to the last call to assign.

§ 32.7.5 Locale

locale_type imbue(locale_type loc);

Effects: Returns the result of traits_inst.imbue(loc) where traits_inst is a (default-initialized) instance of the template type argument traits stored within the object. After a call to imbue the basic_regex object does not match any character sequence.

locale_type getloc() const;

Effects: Returns the result of traits_inst.getloc() where traits_inst is a (default-initialized) instance of the template parameter traits stored within the object.

§ 32.7.6 Swap

void swap(basic_regex& e);

Effects: Swaps the contents of the two regular expressions.

Postconditions: *this contains the regular expression that was in e, e contains the regular expression that was in *this.

Complexity: Constant time.

§ 32.7.7 Non-member functions

template<class charT, class traits>
    void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);

Effects: Calls lhs.swap(rhs).

§ 32.8 Class template sub_match

32.8.1 General

Class template sub_match denotes the sequence of characters matched by a particular marked sub-expression.

namespace std {
    template<class BidirectionalIterator>
        class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
            public:
                using value_type = typename iterator_traits<BidirectionalIterator>::value_type;
                using difference_type = typename iterator_traits<BidirectionalIterator>::difference_type;
                using iterator = BidirectionalIterator;
                using string_type = basic_string<value_type>;

                bool matched;

§ 32.8.1
constexpr sub_match();

difference_type length() const;
operator string_type() const;
string_type str() const;

int compare(const sub_match& s) const;
int compare(const string_type& s) const;
int compare(const value_type* s) const;

void swap(sub_match& s) noexcept(see below);
};

32.8.2 Members

constexpr sub_match();

1 Effects: Value-initializes the pair base class subobject and the member matched.

difference_type length() const;
2 Returns: matched ? distance(first, second) : 0.
operator string_type() const;
3 Returns: matched ? string_type(first, second) : string_type().

string_type str() const;
4 Returns: matched ? string_type(first, second) : string_type().

int compare(const sub_match& s) const;
5 Returns: str().compare(s.str()).
int compare(const string_type& s) const;
6 Returns: str().compare(s).
int compare(const value_type* s) const;
7 Returns: str().compare(s).

void swap(sub_match& s) noexcept(see below);
8 Preconditions: BidirectionalIterator meets the Cpp17Swappable requirements (16.4.4.3).
9 Effects: Equivalent to:
   this->pair<BidirectionalIterator, BidirectionalIterator>::swap(s);
   std::swap(matched, s.matched);
10 Remarks: The exception specification is equivalent to is_nothrow_swappable_v<BidirectionalIterator>.

32.8.3 Non-member operators

§ 32.8.3 1805
template<class BiIter, class ST, class SA>
bool operator==(const sub_match<BiIter>& lhs, 
const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);  

Returns: 
    lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0

template<class BiIter, class ST, class SA>
auto operator<=>(const sub_match<BiIter>& lhs, 
const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);  

Returns: 
    static_cast<SM-CAT(BiIter)>(lhs.compare(
        typename sub_match<BiIter>::string_type(rhs.data(), rhs.size()))
    <=> 0)

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, 
const typename iterator_traits<BiIter>::value_type* rhs);  

Returns: 
    lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs, 
const typename iterator_traits<BiIter>::value_type* rhs);  

Returns: 
    static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0)

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, 
const typename iterator_traits<BiIter>::value_type& rhs);  

Returns: 
    lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs, 
const typename iterator_traits<BiIter>::value_type& rhs);  

Returns: 
    static_cast<SM-CAT(BiIter)>(lhs.compare(
        typename sub_match<BiIter>::string_type(1, rhs))
    <=> 0)

template<class charT, class ST, class BiIter>
basic_ostream<charT, ST>& operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);  

Returns: 
    os << m.str().

32.9 Class template match_results

32.9.1 General

Class template match_results denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match_results.

The class template match_results meets the requirements of an allocator-aware container and of a sequence container (24.2.2.5, 24.2.4) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.

A default-constructed match_results object has no fully established result state. A match result is ready when, as a consequence of a completed regular expression match modifying such an object, its result state
becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.

4 The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters `[first, second)` which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched.

[Note 1: The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — end note]

namespace std {
    
    template<class BidirectionalIterator, 
             class Allocator = allocator<sub_match<BidirectionalIterator>>> 
    class match_results {
        public:
            using value_type = sub_match<BidirectionalIterator>;
            using const_reference = const value_type&;
            using reference = value_type&;
            using const_iterator = implementation-defined;
            using iterator = const_iterator;
            using difference_type = 
                typename iterator_traits<BidirectionalIterator>::difference_type;
            using size_type = typename Allocator_traits<Allocator>::size_type;
            using allocator_type = Allocator;
            using char_type = 
                typename iterator_traits<BidirectionalIterator>::value_type;
            using string_type = basic_string<char_type>;

            // 32.9.2, construct/copy/destroy
            match_results() : match_results(Allocator()) {} 
            explicit match_results(const Allocator& a); 
            match_results(const match_results& m); 
            match_results(const match_results& m, const Allocator& a); 
            match_results(match_results&& m) noexcept; 
            match_results(match_results&& m, const Allocator& a); 
            match_results& operator=(const match_results& m); 
            match_results& operator=(match_results&& m); 
            ~match_results(); 

            // 32.9.3, state
            bool ready() const; 

            // 32.9.4, size
            size_type size() const; 
            size_type max_size() const; 
            [[nodiscard]] bool empty() const; 

            // 32.9.5, element access 
            difference_type length(size_type sub = 0) const; 
            difference_type position(size_type sub = 0) const; 
            string_type str(size_type sub = 0) const; 
            const_reference operator[](size_type n) const; 

            const_reference prefix() const; 
            const_reference suffix() const; 
            const_iterator begin() const; 
            const_iterator end() const; 
            const_iterator cbegin() const; 
            const_iterator cend() const; 

    } // end class match_results

§ 32.9.1
template<class OutputIter>
OutputIter
format(OutputIter out,
const char_type* fmt_first, const char_type* fmt_last,
regex_constants::match_flag_type flags = regex_constants::format_default) const;

// 32.9.7, allocator
allocator_type get_allocator() const;

// 32.9.8, swap
void swap(match_results& that);

32.9.2 Constructors

Table 141 lists the postconditions of match_results copy/move constructors and copy/move assignment operators. For move operations, the results of the expressions depending on the parameter m denote the values they had before the respective function calls.

explicit match_results(const Allocator& a);

Effects: The stored Allocator value is constructed from a.

Postconditions: ready() returns false. size() returns 0.

match_results(const match_results& m);

Effects: For the first form, the stored Allocator value is obtained as specified in 24.2.2.2. For the second form, the stored Allocator value is constructed from a.

Postconditions: As specified in Table 141.

match_results(match_results&& m) noexcept;

Effects: For the first form, the stored Allocator value is move constructed from m.get_allocator(). For the second form, the stored Allocator value is constructed from a.

Postconditions: As specified in Table 141.

match_results& operator=(const match_results& m);

Postconditions: As specified in Table 141.

match_results& operator=(match_results&& m);

Postconditions: As specified in Table 141.

32.9.3 State

bool ready() const;

Returns: true if *this has a fully established result state, otherwise false.
Table 141: match_results copy/move operation postconditions

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ready()</td>
<td>m.ready()</td>
</tr>
<tr>
<td>size()</td>
<td>m.size()</td>
</tr>
<tr>
<td>str(n)</td>
<td>m.str(n) for all non-negative integers n &lt; m.size()</td>
</tr>
<tr>
<td>prefix()</td>
<td>m.prefix()</td>
</tr>
<tr>
<td>suffix()</td>
<td>m.suffix()</td>
</tr>
<tr>
<td>(*this)[n]</td>
<td>m[n] for all non-negative integers n &lt; m.size()</td>
</tr>
<tr>
<td>length(n)</td>
<td>m.length(n) for all non-negative integers n &lt; m.size()</td>
</tr>
<tr>
<td>position(n)</td>
<td>m.position(n) for all non-negative integers n &lt; m.size()</td>
</tr>
</tbody>
</table>

32.9.4 Size

size_type size() const;

Returns: One plus the number of marked sub-expressions in the regular expression that was matched if *this represents the result of a successful match. Otherwise returns 0.

[Note 1: The state of a match_results object can be modified only by passing that object to regex_match or regex_search. Subclauses 32.10.2 and 32.10.3 specify the effects of those algorithms on their match_results arguments. — end note]

size_type max_size() const;

Returns: The maximum number of sub_match elements that can be stored in *this.

[[nodiscard]] bool empty() const;

Returns: size() == 0.

32.9.5 Element access

difference_type length(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: (*this)[sub].length().

difference_type position(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: The distance from the start of the target sequence to (*this)[sub].first.

string_type str(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: string_type((*this)[sub]).

const_reference operator[](size_type n) const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence that matched marked sub-expression n. If n == 0 then returns a reference to a sub_match object representing the character sequence that matched the whole regular expression. If n >= size() then returns a sub_match object representing an unmatched sub-expression.

const_reference prefix() const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence from the start of the string being matched/searched to the start of the match found.
const_reference suffix() const;
11  Preconditions: ready() == true.
12  Returns: A reference to the sub_match object representing the character sequence from the end of the
match found to the end of the string being matched/searched.

const_iterator begin() const;
const_iterator cbegin() const;
13  Returns: A starting iterator that enumerates over all the sub-expressions stored in *this.

const_iterator end() const;
const_iterator cend() const;
14  Returns: A terminating iterator that enumerates over all the sub-expressions stored in *this.

32.9.6 Formatting [re.results.form]

template<class OutputIter>
OutputIter format(
  OutputIter out,
  const char_type* fmt_first, const char_type* fmt_last,
  regex_constants::match_flag_type flags = regex_constants::format_default) const;
1  Preconditions: ready() == true and OutputIter meets the requirements for a Cpp17OutputIterator
(25.3.5.4).
2  Effects: Copies the character sequence [fmt_first, fmt_last) to OutputIter out. Replaces each format
specifier or escape sequence in the copied range with either the character(s) it represents or the sequence
of characters within *this to which it refers. The bitmasks specified in flags determine which format
specifiers and escape sequences are recognized.
3  Returns: out.

template<class OutputIter, class ST, class SA>
OutputIter format(
  OutputIter out,
  const basic_string<char_type, ST, SA>& fmt,
  regex_constants::match_flag_type flags = regex_constants::format_default) const;
4  Effects: Equivalent to:
             return format(out, fmt.data(), fmt.data() + fmt.size(), flags);

template<class ST, class SA>
basic_string<char_type, ST, SA> format(
  const basic_string<char_type, ST, SA>& fmt,
  regex_constants::match_flag_type flags = regex_constants::format_default) const;
5  Preconditions: ready() == true.
6  Effects: Constructs an empty string result of type basic_string<char_type, ST, SA> and calls:
             format(back_inserter(result), fmt, flags);
7  Returns: result.

string_type format(
  const char_type* fmt,
  regex_constants::match_flag_type flags = regex_constants::format_default) const;
8  Preconditions: ready() == true.
9  Effects: Constructs an empty string result of type string_type and calls:
             format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);
10  Returns: result.
32.9.7 Allocator

allocator_type get_allocator() const;

Returns: A copy of the Allocator that was passed to the object's constructor or, if that allocator has been replaced, a copy of the most recent replacement.

32.9.8 Swap

void swap(match_results& that);

Effects: Swaps the contents of the two sequences.

Postconditions: *this contains the sequence of matched sub-expressions that were in that, that contains the sequence of matched sub-expressions that were in *this.

Complexity: Constant time.

 template<class BidirectionalIterator, class Allocator>
 void swap(match_results<BidirectionalIterator, Allocator>& m1, match_results<BidirectionalIterator, Allocator>& m2);

Effects: As if by m1.swap(m2).

32.9.9 Non-member functions

template<class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1, const match_results<BidirectionalIterator, Allocator>& m2);

Returns: true if neither match result is ready, false if one match result is ready and the other is not. If both match results are ready, returns true only if:

1. m1.empty() && m2.empty(), or
2. !m1.empty() && !m2.empty(), and the following conditions are satisfied:
   1. m1.prefix() == m2.prefix(),
   2. m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin()), and
   3. m1.suffix() == m2.suffix().

[Note 1: The algorithm equal is defined in Clause 27. — end note]

32.10 Regular expression algorithms

32.10.1 Exceptions

The algorithms described in subclause 32.10 may throw an exception of type regex_error. If such an exception e is thrown, e.code() shall return either regex_constants::error_complexity or regex_constants::error_stack.

32.10.2 regex_match

template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last, match_results<BidirectionalIterator, Allocator>& m, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);

Preconditions: BidirectionalIterator models bidirectional_iterator (25.3.4.12).

Effects: Determines whether there is a match between the regular expression e, and all of the character sequence [first,last). The parameter flags is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns true if such a match exists, false otherwise.

[Example 1:]
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re); // returns true, and m[0] contains "Get"
regex_match ("GetValue", m, re); // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re); // returns true, and m[0] contains "Get"
regex_match("GetValues", m, re); // returns false

— end example]

Postconditions: m.ready() == true in all cases. If the function returns false, then the effect on parameter m is unspecified except that m.size() returns 0 and m.empty() returns true. Otherwise the effects on parameter m are given in Table 142.

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>m.size()</td>
<td>1 + e.mark_count()</td>
</tr>
<tr>
<td>m.empty()</td>
<td>false</td>
</tr>
<tr>
<td>m.prefix().first</td>
<td>first</td>
</tr>
<tr>
<td>m.prefix().second</td>
<td>first</td>
</tr>
<tr>
<td>m.prefix().matched</td>
<td>false</td>
</tr>
<tr>
<td>m.suffix().first</td>
<td>last</td>
</tr>
<tr>
<td>m.suffix().second</td>
<td>last</td>
</tr>
<tr>
<td>m.suffix().matched</td>
<td>false</td>
</tr>
<tr>
<td>m[0].first</td>
<td>first</td>
</tr>
<tr>
<td>m[0].second</td>
<td>last</td>
</tr>
<tr>
<td>m[0].matched</td>
<td>true</td>
</tr>
<tr>
<td>m[n].first</td>
<td>For all integers 0 &lt; n &lt; m.size(), the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].second</td>
<td>For all integers 0 &lt; n &lt; m.size(), the end of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].matched</td>
<td>For all integers 0 &lt; n &lt; m.size(), true if sub-expression n participated in the match, false otherwise.</td>
</tr>
</tbody>
</table>

4 Effects: Behaves “as if” by constructing an instance of match_results<BidirectionalIterator>, what, and then returning the result of regex_match(first, last, what, e, flags).

5 Returns: regex_match(str, str + char_traits<charT>::length(str), m, e, flags).

6 Returns: regex_match(s.begin(), s.end(), m, e, flags).

7 Returns: regex_match(str, str + char_traits<charT>::length(str), e, flags)
template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: regex_match(s.begin(), s.end(), e, flags).

32.10.3 regex_search [re.alg.search]

template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
match_results<BidirectionalIterator, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Preconditions: BidirectionalIterator models bidirectional_iterator (25.3.4.12).

Effects: Determines whether there is some sub-sequence within [first, last) that matches the regular
expression e. The parameter flags is used to control how the expression is matched against the
character sequence. Returns true if such a sequence exists, false otherwise.

Postconditions: m.ready() == true in all cases. If the function returns false, then the effect on
parameter m is unspecified except that m.size() returns 0 and m.empty() returns true. Otherwise
the effects on parameter m are given in Table 143.

Table 143: Effects of regex_search algorithm [tab:re.alg.search]

<td>true</td>
</tr>
<tr>
<td>m[n].first</td>
<td>For all integers 0 &lt; n &lt; m.size(), the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].second</td>
<td>For all integers 0 &lt; n &lt; m.size(), the end of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].matched</td>
<td>For all integers 0 &lt; n &lt; m.size(), true if sub-expression n participated in the match, false otherwise.</td>
</tr>
</tbody>
</table>

template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: regex_search(str, str + char_traits<charT>::length(str), m, e, flags).

§ 32.10.3 1813
template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
match_results<typename basic_string<charT, ST, SA>::const_iterator,
Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: regex_search(s.begin(), s.end(), m, e, flags).

Effects: Behaves “as if” by constructing an object of type match_results<BidirectionalIterator> and returning regex_search(first, last, what, e, flags).

template<class charT, class traits>
bool regex_search(const charT* str,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: regex_search(str, str + char_traits<charT>::length(str), e, flags).

32.10.4 regex_replace
[re.alg.replace]

template<class OutputIterator, class BidirectionalIterator,
class traits, class charT, class ST, class SA>

OutputIterator
regex_replace(OutputIterator out,
BidirectionalIterator first, BidirectionalIterator last,
const basic_regex<charT, traits>& e,
const basic_string<charT, ST, SA>& fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

template<class OutputIterator, class BidirectionalIterator, class traits, class charT>

OutputIterator
regex_replace(OutputIterator out,
BidirectionalIterator first, BidirectionalIterator last,
const basic_regex<charT, traits>& e,
const charT* fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

Effects: Constructs a regex_iterator object i as if by
regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)
and uses i to enumerate through all of the matches m of type match_results<BidirectionalIterator> that occur within the sequence [first,last). If no such matches are found and !(flags & regex_constants::format_no_copy), then calls
out = copy(first, last, out)

If any matches are found then, for each such match:

1. If !(flags & regex_constants::format_no_copy), calls
   out = copy(m.prefix().first, m.prefix().second, out)
2. Then calls
   out = m.format(out, fmt, flags)
for the first form of the function and
out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)
for the second.

Finally, if such a match is found and !(flags & regex_constants::format_no_copy), calls

```
out = copy(last_m.suffix().first, last_m.suffix().second, out)
```

where last_m is a copy of the last match found. If flags & regex_constants::format_first_only is nonzero, then only the first match found is replaced.

Returns: out.

```
template<class traits, class charT, class ST, class SA, class FST, class FSA>
basic_string<charT, ST, SA>
regex_replace(const basic_string<charT, ST, SA>& s,
const basic_regex<charT, traits>& e,
const basic_string<charT, FST, FSA>& fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

```
template<class traits, class charT, class ST, class SA>
basic_string<charT, ST, SA>
regex_replace(const basic_string<charT, ST, SA>& s,
const basic_regex<charT, traits>& e,
const charT* fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

Effects: Constructs an empty string result of type basic_string<charT, ST, SA> and calls:

```
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);
```

Returns: result.

```
template<class traits, class charT, class ST, class SA>
basic_string<charT>
regex_replace(const charT* s,
const basic_regex<charT, traits>& e,
const basic_string<charT, ST, SA>& fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

```
template<class traits, class charT>
basic_string<charT>
regex_replace(const charT* s,
const basic_regex<charT, traits>& e,
const charT* fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

Effects: Constructs an empty string result of type basic_string<charT> and calls:

```
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);
```

Returns: result.

### 32.11 Regular expression iterators

#### 32.11.1 Class template regex_iterator

The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a const `match_results<BidirectionalIterator>` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a const `match_results<BidirectionalIterator>` is returned. It is impossible to store things into `regex_iterator`s. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.
namespace std {
  template<class BidirectionalIterator,
           class charT = typename iterator_traits<BidirectionalIterator>::value_type,
           class traits = regex_traits<charT>>
  class regex_iterator {
    public:
      using regex_type = basic_regex<charT, traits>;
      using iterator_category = forward_iterator_tag;
      using iterator_concept = input_iterator_tag;
      using value_type = match_results<BidirectionalIterator>;
      using difference_type = ptrdiff_t;
      using pointer = const value_type*;
      using reference = const value_type&;

      regex_iterator();
      regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     regex_constants::match_flag_type m = regex_constants::match_default);
      regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type&& re,
                     regex_constants::match_flag_type = regex_constants::match_default) = delete;
      regex_iterator(const regex_iterator&);
      regex_iterator& operator=(const regex_iterator&);
      bool operator==(const regex_iterator&) const;
      const value_type& operator*() const;
      const value_type* operator->() const;
      regex_iterator& operator++();
      regex_iterator operator++(int);

    private:
      BidirectionalIterator begin;       // exposition only
      BidirectionalIterator end;         // exposition only
      const regex_type* pregex;          // exposition only
      regex_constants::match_flag_type flags;  // exposition only
      match_results<BidirectionalIterator> match;  // exposition only
    }
  };

An object of type regex_iterator that is not an end-of-sequence iterator holds a zero-length match if match[0].matched == true and match[0].first == match[0].second.

[Note 1: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as '^', '$', '\b', '\'B'). — end note]

32.11.1.2 Constructors

regex_iterator();

Effects: Constructs an end-of-sequence iterator.

regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
               const regex_type& re,
               regex_constants::match_flag_type m = regex_constants::match_default);

Effects: Initializes begin and end to a and b, respectively, sets pregex to addressof(re), sets flags to m, then calls regex_search(begin, end, match, *pregex, flags). If this call returns false the constructor sets *this to the end-of-sequence iterator.

32.11.1.3 Comparisons

bool operator==(const regex_iterator& right) const;

Returns: true if *this and right are both end-of-sequence iterators or if the following conditions all hold:

(1.1) begin == right.begin,
— end == right.end,
—pregex == right.pregex,
—flags == right.flags, and
—match[0] == right.match[0];
otherwise false.

32.11.1.4 Indirection [re.register.deref]

const value_type& operator*() const;

Returns: match.

const value_type* operator->() const;

Returns: addressof(match).

32.11.1.5 Increment [re.register.incr]

regex_iterator& operator++();

Effects: Constructs a local variable start of type BidirectionalIterator and initializes it with the value of match[0].second.

If the iterator holds a zero-length match and start == end the operator sets *this to the end-of-sequence iterator and returns *this.

Otherwise, if the iterator holds a zero-length match, the operator calls:

regex_search(start, end, match, *pregex,
              flags | regex_constants::match_not_null | regex_constants::match_continuous)

If the call returns true the operator returns *this. Otherwise the operator increments start and continues as if the most recent match was not a zero-length match.

If the most recent match was not a zero-length match, the operator sets flags to flags | regex_constants::match_prev_avail and calls regex_search(start, end, match, *pregex, flags). If the call returns false the iterator sets *this to the end-of-sequence iterator. The iterator then returns *this.

In all cases in which the call to regex_search returns true, match.prefix().first shall be equal to the previous value of match[0].second, and for each index i in the half-open range [0, match.size()) for which match[i].matched is true, match.position(i) shall return distance(begin, match[i].first).

[Note 1: This means that match.position(i) gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to regex_search. — end note]

It is unspecified how the implementation makes these adjustments.

[Note 2: This means that an implementation can call an implementation-specific search function, in which case a program-defined specialization of regex_search will not be called. — end note]

regex_iterator operator++(int);

Effects: As if by:

regex_iterator tmp = *this;
++(*this);
return tmp;

32.11.2 Class template regex_token_iterator [re.tokiter]

32.11.2.1 General [re.tokiter.general]

The class template regex_token_iterator is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a sub_match class template instance that represents what matched a particular sub-expression within the regular expression.
When class `regex_token_iterator` is used to enumerate a single sub-expression with index \(-1\) the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.

After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator>` `position` and sets the internal count \(N\) to zero. It also maintains a sequence `subs` which contains a list of the sub-expressions which will be enumerated. Every time `operator++` is used the count \(N\) is incremented; if \(N\) exceeds or equals `subs.size()` , then the iterator increments member `position` and sets count \(N\) to zero.

If the end of sequence is reached (`position` is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index \(-1\), in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.

The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>` is returned.

It is impossible to store things into `regex_token_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```cpp
namespace std {
    template<class BidirectionalIterator,
        class charT = typename iterator_traits<BidirectionalIterator>::value_type,
        class traits = regex_traits<charT>>
    class regex_token_iterator {
        public:
            using regex_type = basic_regex<charT, traits>;
            using iterator_category = forward_iterator_tag;
            using iterator_concept = input_iterator_tag;
            using value_type = sub_match<BidirectionalIterator>;
            using difference_type = ptrdiff_t;
            using pointer = const value_type*;
            using reference = const value_type&;

            regex_token_iterator();
            regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                const regex_type& re,
                int submatch = 0,
                regex_constants::match_flag_type m =
                regex_constants::match_default);
            regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                const regex_type& re,
                const vector<int>& submatches,
                regex_constants::match_flag_type m =
                regex_constants::match_default);
            regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                const regex_type& re,
                initializer_list<int> submatches,
                regex_constants::match_flag_type m =
                regex_constants::match_default);
            regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                const regex_type& re,
                int (&submatches)[N],
                regex_constants::match_flag_type m =
                regex_constants::match_default);
            regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                const regex_type& re,
                int submatch = 0,
                regex_constants::match_flag_type m =
                regex_constants::match_default);
```
A suffix iterator is a regex_token_iterator object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member result holds a pointer to the data member suffix, the value of the member suffix.match is true, suffix.first points to the beginning of the final sequence, and suffix.second points to the end of the final sequence.

[Note 1: For a suffix iterator, data member suffix.first is the same as the end of the last match found, and suffix.second is the same as the end of the target sequence. —end note]

The current match is (*position).prefix() if subs[N] == -1, or (*position)[subs[N]] for any other value of subs[N].

32.11.2.2 Constructors

regex_token_iterator();

Effects: Constructs the end-of-sequence iterator.
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,  
    const regex_type& re,  
    initializer_list<int> submatches,  
    regex_constants::match_flag_type m = regex_constants::match_default);

template<size_t N>  
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,  
    const regex_type& re,  
    const int (&submatches)[N],  
    regex_constants::match_flag_type m = regex_constants::match_default);

2 Preconditions: Each of the initialization values of submatches is >= -1.

3 Effects: The first constructor initializes the member subs to hold the single value submatch. The second, third, and fourth constructors initialize the member subs to hold a copy of the sequence of integer values pointed to by the iterator range [begin(submatches), end(submatches)].

Each constructor then sets N to 0, and position to position_iterator(a, b, re, m). If position is not an end-of-sequence iterator the constructor sets result to the address of the current match. Otherwise if any of the values stored in subs is equal to -1 the constructor sets *this to a suffix iterator that points to the range [a, b), otherwise the constructor sets *this to an end-of-sequence iterator.

32.11.2.3 Comparisons

bool operator==(const regex_token_iterator& right) const;

Returns: true if *this and right are both end-of-sequence iterators, or if *this and right are both suffix iterators and suffix == right.suffix; otherwise returns false if *this or right is an end-of-sequence iterator or a suffix iterator. Otherwise returns true if position == right.position, N == right.N, and subs == right.subs. Otherwise returns false.

32.11.2.4 Indirection

const value_type& operator*() const;

Returns: *result.

const value_type* operator->() const;

Returns: result.

32.11.2.5 Increment

regex_token_iterator& operator++();

Effects: Constructs a local variable prev of type position_iterator, initialized with the value of position.

If *this is a suffix iterator, sets *this to an end-of-sequence iterator.

Otherwise, if N + 1 < subs.size(), increments N and sets result to the address of the current match.

Otherwise, sets N to 0 and increments position. If position is not an end-of-sequence iterator the operator sets result to the address of the current match.

Otherwise, if any of the values stored in subs is equal to -1 and prev->suffix().length() is not 0 the operator sets *this to a suffix iterator that points to the range [prev->suffix().first, prev->suffix().second).

Otherwise, sets *this to an end-of-sequence iterator.

Returns: *this.

regex_token_iterator& operator++(int);

Effects: Constructs a copy tmp of *this, then calls ++(*this).

Returns: tmp.

§ 32.11.2.5
32.12 Modified ECMAScript regular expression grammar

The regular expression grammar recognized by basic_regex objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.

Objects of type specialization of basic_regex store within themselves a default-constructed instance of their traits template parameter, henceforth referred to as traits_inst. This traits_inst object is used to support localization of the regular expression; basic_regex member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.

The following productions within the ECMAScript grammar are modified as follows:

- ClassAtom
  - ClassAtomNoDash
  - ClassAtomExClass
  - ClassAtomCollatingElement
  - ClassAtomEquivalence

IdentityEscape
- SourceCharacter but not c

The following new productions are then added:

- ClassAtomExClass
  - [: ClassName :]
- ClassAtomCollatingElement
  - [. ClassName .]
- ClassAtomEquivalence
  - [= ClassName =]

ClassName
- ClassNameCharacter
- ClassNameCharacter ClassName

ClassNameCharacter
- SourceCharacter but not one of . or = or :

The productions ClassAtomExClass, ClassAtomCollatingElement and ClassAtomEquivalence provide functionality equivalent to that of the same features in regular expressions in POSIX.

The regular expression grammar may be modified by any regex_constants::syntax_option_type flags specified when constructing an object of type specialization of basic_regex according to the rules in Table 137.

A ClassName production, when used in a ClassAtomExClass production is not valid if the value returned by traits_inst.lookup_classname for that name is an empty string.

The results from multiple calls to traits_inst.lookup_classname can be bitwise OR’ed together and subsequently passed to traits_inst.isctype.
A `ClassName` production when used in a `ClassAtomEquivalence` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.

When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.

If the `CV` of a `UnicodeEscapeSequence` is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.

[Note 1: This means that values of the form "uxxxx" that do not fit in a character are invalid. — end note]

Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.

The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (32.4.3) specified when using the regular expression object in one of the regular expression algorithms (32.10). The behavior is also localized by interaction with the traits class template parameter as follows:

(14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters `c` and `d` are compared using the following rules:

(14.1.1) — if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d);`

(14.1.2) — otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d);`

(14.1.3) — otherwise, the two characters are equal if `c == d`.

(14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range `c1-c2` against a character `c` is conducted as follows: if `flags() & regex_constants::collate` is false then the character `c` is matched if `c1 <= c && c <= c2`, otherwise `c` is matched in accordance with the following algorithm:

```cpp
string_type str1 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end())
    <= traits_inst.transform(str.begin(), str.end())
    && traits_inst.transform(str.begin(), str.end())
    <= traits_inst.transform(str2.begin(), str2.end());
```

(14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting the collating element and the equivalence class to sort keys using `traits::transform_primary`, and then comparing the sort keys for equality.

(14.4) — During matching of a regular expression finite state machine against a sequence of characters, a character `c` is a member of a character class designated by an iterator range `[first, last)` if `traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase))` is true.

33.2 Requirements

33.2.1 Template parameter names

Throughout this Clause, the names of template parameters are used to express type requirements. Predicate is a function object type (22.10). Let \( \text{pred} \) denote an lvalue of type Predicate. Then the expression \( \text{pred()} \) shall be well-formed and the type \( \text{decltype(pred())} \) shall model boolean-testable (18.5.2). The return value of \( \text{pred()} \), converted to bool, yields true if the corresponding test condition is satisfied, and false otherwise. If a template parameter is named Clock, the corresponding template argument shall be a type \( C \) that meets the Cpp17Clock requirements (29.3); the program is ill-formed if \( \text{is_clock_v}<C> \) is false.

33.2.2 Exceptions

Some functions described in this Clause are specified to throw exceptions of type system_error (19.5.8). Such exceptions are thrown if any of the function’s error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in 16.4.6.13.

[Example 1: Consider a function in this Clause that is specified to throw exceptions of type system_error and specifies error conditions that include operation_not_permitted for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an errno of EPERM is reported by a POSIX API call used by the implementation. Since POSIX specifies an errno of EPERM when “the caller does not have the privilege to perform the operation”, the implementation maps EPERM to an error_condition of operation_not_permitted (19.5) and an exception of type system_error is thrown. — end example]

2 The error_code reported by such an exception’s code() member function compares equal to one of the conditions specified in the function’s error condition element.

33.2.3 Native handles

Several classes described in this Clause have members native_handle_type and native_handle. The presence of these members and their semantics is implementation-defined.

[Note 1: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — end note]
33.2.4 Timing specifications

Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a duration or a time_point type as specified in Clause 29.

Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration $D_i$. Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration $D_m$. The delay durations may vary from timeout to timeout, but in all cases shorter is better.

The functions whose names end in _for take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions. Given a duration argument $D_t$, the real-time duration of the timeout is $D_t + D_i + D_m$.

The functions whose names end in _until take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument $C_t$, the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time $C_a$ during the timeout, the behavior should be as follows:

1. If $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_i + D_m$, since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.

2. If $C_a \leq C_t$, the waiting function should not time out until `Clock::now()` returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_i + D_m$.

[Note 1: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. —end note]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between $C_t$ and the time point of the call to the _until function.

Recommended practice: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

[Note 2: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts can fail to provide useful functionality. —end note]

The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the native resolution.

Implementation-provided clocks that are used for these functions meet the Cpp17TrivialClock requirements (29.3).

A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as timeout-related exceptions. [Note 3: Instantiations of clock, time point and duration types supplied by the implementation as specified in 29.7 do not throw exceptions. —end note]

33.2.5 Requirements for Cpp17Lockable types

33.2.5.1 In general

An execution agent is an entity such as a thread that may perform work in parallel with other execution agents.

[Note 1: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. —end note]

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

[Note 2: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). —end note]
The standard library templates `unique_lock` (33.6.5.4), `shared_lock` (33.6.5.5), `scoped_lock` (33.6.5.3), `lock_guard` (33.6.5.2), `lock`, `try_lock` (33.6.6), and `condition_variable_any` (33.7.5) all operate on user-supplied lockable objects. The `Cpp17BasicLockable` requirements, the `Cpp17Lockable` requirements, the `Cpp17TimedLockable` requirements, the `Cpp17SharedLockable` requirements, and the `Cpp17SharedTimedLockable` requirements list the requirements imposed by these library types in order to acquire or release ownership of a lock by a given execution agent.

[Note 3: The nature of any lock ownership and any synchronization it entails are not part of these requirements. — end note]

A lock on an object \( m \) is said to be

1. a non-shared lock if it is acquired by a call to `lock`, `try_lock`, `try_lock_for`, or `try_lock_until` on \( m \), or
2. a shared lock if it is acquired by a call to `lock_shared`, `try_lock_shared`, `try_lock_shared_for`, or `try_lock_shared_until` on \( m \).

[Note 4: Only the method of lock acquisition is considered; the nature of any lock ownership is not part of these definitions. — end note]

### 33.2.5.2 `Cpp17BasicLockable` requirements

A type \( L \) meets the `Cpp17BasicLockable` requirements if the following expressions are well-formed and have the specified semantics (\( m \) denotes a value of type \( L \)).

- \( m.lock() \)
  - **Effects**: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.
  - **Preconditions**: None.
  - **Returns**: None.

- \( m.unlock() \)
  - **Preconditions**: The current execution agent holds a non-shared lock on \( m \).
  - **Effects**: Releases a non-shared lock on \( m \) held by the current execution agent.
  - **Throws**: Nothing.

### 33.2.5.3 `Cpp17Lockable` requirements

A type \( L \) meets the `Cpp17Lockable` requirements if it meets the `Cpp17BasicLockable` requirements and the following expressions are well-formed and have the specified semantics (\( m \) denotes a value of type \( L \)).

- \( m.try_lock() \)
  - **Effects**: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.
  - **Return type**: bool.
  - **Returns**: true if the lock was acquired, otherwise false.

### 33.2.5.4 `Cpp17TimedLockable` requirements

A type \( L \) meets the `Cpp17TimedLockable` requirements if it meets the `Cpp17Lockable` requirements and the following expressions are well-formed and have the specified semantics (\( m \) denotes a value of type \( L \), \( rel_time \) denotes a value of an instantiation of `duration` (29.5), and \( abs_time \) denotes a value of an instantiation of `time_point` (29.6)).

- \( m.try_lock_for(rel_time) \)
  - **Effects**: Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by \( rel_time \). The function will not return within the timeout specified by \( rel_time \) unless it has obtained a lock on \( m \) for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.
  - **Return type**: bool.
  - **Returns**: true if the lock was acquired, otherwise false.
m.try_lock_until(abs_time)

Effects: Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by abs_time. The function will not return before the timeout specified by abs_time unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

Returns type: bool.

Returns: true if the lock was acquired, otherwise false.

**33.2.5.5 Cpp17SharedLockable requirements**

A type L meets the Cpp17SharedLockable requirements if the following expressions are well-formed, have the specified semantics, and the expression m.try_lock_shared() has type bool (m denotes a value of type L):

m.lock_shared()

Effects: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

m.try_lock_shared()

Effects: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

Returns: true if the lock was acquired, false otherwise.

m.unlock_shared()

Preconditions: The current execution agent holds a shared lock on m.

Effects: Releases a shared lock on m held by the current execution agent.

Throws: Nothing.

**33.2.5.6 Cpp17SharedTimedLockable requirements**

A type L meets the Cpp17SharedTimedLockable requirements if it meets the Cpp17SharedLockable requirements, and the following expressions are well-formed, have type bool, and have the specified semantics (m denotes a value of type L, rel_time denotes a value of a specialization of chrono::duration, and abs_time denotes a value of a specialization of chrono::time_point).

m.try_lock_shared_for(rel_time)

Effects: Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by rel_time. The function will not return within the timeout specified by rel_time unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

Returns: true if the lock was acquired, false otherwise.

m.try_lock_shared_until(abs_time)

Effects: Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by abs_time. The function will not return before the timeout specified by abs_time unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

Returns: true if the lock was acquired, false otherwise.

**33.3 Stop tokens**

**33.3.1 Introduction**

Subclause 33.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a stop request.

stop_source, stop_token, and stop_callback implement semantics of shared ownership of a stop state. Any stop_source, stop_token, or stop_callback that shares ownership of the same stop state is an associated stop_source, stop_token, or stop_callback, respectively. The last remaining owner of the stop state automatically releases the resources associated with the stop state.
A `stop_token` can be passed to an operation which can either
- actively poll the token to check if there has been a stop request, or
- register a callback using the `stop_callback` class template which will be called in the event that a stop request is made.

A stop request made via a `stop_source` will be visible to all associated `stop_token` and `stop_source` objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

Callbacks registered via a `stop_callback` object are called when a stop request is first made by any associated `stop_source` object.

Calls to the functions `request_stop`, `stop_requested`, and `stop_possible` do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stop_token` or `stop_source` object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.

### 33.3.2 Header `<stop_token>` synopsis

```cpp
namespace std {
    // 33.3.3, class stop_token
class stop_token;
    // 33.3.4, class stop_source
class stop_source;
    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};
    // 33.3.5, class template stop_callback
template<class Callback>
class stop_callback;
}
```

### 33.3.3 Class `stop_token`

#### 33.3.3.1 General

The class `stop_token` provides an interface for querying whether a stop request has been made (`stop_requested`) or can ever be made (`stop_possible`) using an associated `stop_source` object (33.3.4). A `stop_token` can also be passed to a `stop_callback` (33.3.5) constructor to register a callback to be called when a stop request has been made from an associated `stop_source`.

```cpp
namespace std {
    class stop_token {
        // 33.3.3.2, constructors, copy, and assignment
        stop_token() noexcept;
        stop_token(const stop_token&) noexcept;
        stop_token(stop_token&&) noexcept;
        stop_token& operator=(const stop_token&) noexcept;
        stop_token& operator=(stop_token&&) noexcept;
        ~stop_token();
        void swap(stop_token&) noexcept;
        
        // 33.3.3.3, stop handling
        [[nodiscard]] bool stop_requested() const noexcept;
        [[nodiscard]] bool stop_possible() const noexcept;
        
        [[nodiscard]] friend bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
        friend void swap(stop_token& lhs, stop_token& rhs) noexcept;
    };
}
```
33.3.3.2 Constructors, copy, and assignment

```cpp
stop_token() noexcept;
```

1. **Postconditions**: `stop_possible()` is false and `stop_requested()` is false.

   [Note 1: Because the created `stop_token` object can never receive a stop request, no resources are allocated for a stop state. — end note]

```cpp
stop_token(const stop_token& rhs) noexcept;
```

2. **Postconditions**: `*this == rhs` is true.

   [Note 2: `*this` and `rhs` share the ownership of the same stop state, if any. — end note]

```cpp
stop_token(stop_token&& rhs) noexcept;
```

3. **Postconditions**: `*this` contains the value of `rhs` prior to the start of construction and `rhs.stop_possible()` is false.

```cpp
~stop_token();
```

4. **Effects**: Releases ownership of the stop state, if any.

```cpp
stop_token& operator=(const stop_token& rhs) noexcept;
```

5. **Effects**: Equivalent to: `stop_token(rhs).swap(*this)`.

6. **Returns**: `*this`.

```cpp
stop_token& operator=(stop_token&& rhs) noexcept;
```

7. **Effects**: Equivalent to: `stop_token(std::move(rhs)).swap(*this)`.

8. **Returns**: `*this`.

```cpp
void swap(stop_token& rhs) noexcept;
```

9. **Effects**: Exchanges the values of `*this` and `rhs`.

33.3.3.3 Members

```cpp
[[nodiscard]] bool stop_requested() const noexcept;
```

1. **Returns**: true if `*this` has ownership of a stop state that has received a stop request; otherwise, false.

```cpp
[[nodiscard]] bool stop_possible() const noexcept;
```

2. **Returns**: false if:

   — `*this` does not have ownership of a stop state, or

   — a stop request was not made and there are no associated `stop_source` objects; otherwise, true.

33.3.4 Non-member functions

```cpp
[[nodiscard]] bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
```

1. **Returns**: true if `lhs` and `rhs` have ownership of the same stop state or if both `lhs` and `rhs` do not have ownership of a stop state; otherwise false.

```cpp
friend void swap(stop_token& x, stop_token& y) noexcept;
```

2. **Effects**: Equivalent to: `x.swap(y)`.

33.3.4 Class `stop_source`  

33.3.4.1 General

The class `stop_source` implements the semantics of making a stop request. A stop request made on a `stop_source` object is visible to all associated `stop_source` and `stop_token` (33.3.3) objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).
namespace std {
    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};

class stop_source {
public:
    // 33.3.4.2, constructors, copy, and assignment
    explicit stop_source(nostopstate_t) noexcept;
    stop_source(const stop_source&) noexcept;
    stop_source(stop_source&&) noexcept;
    stop_source& operator=(const stop_source&) noexcept;
    stop_source& operator=(stop_source&&) noexcept;
    ~stop_source();
    void swap(stop_source&) noexcept;

    // 33.3.4.3, stop handling
    [[nodiscard]] stop_token get_token() const noexcept;
    [[nodiscard]] bool stop_possible() const noexcept;
    [[nodiscard]] bool stop_requested() const noexcept;
    bool request_stop() noexcept;

    // § 33.3.4.2 1829

    stop_source();
1 Effects: Initialises *this to have ownership of a new stop state.
2 Postconditions: stop_possible() is true and stop_requested() is false.
3 Throws: bad_alloc if memory cannot be allocated for the stop state.

    explicit stop_source(nostopstate_t) noexcept;
4 Postconditions: stop_possible() is false and stop_requested() is false.
    [Note 1: No resources are allocated for the state. — end note]

    stop_source(const stop_source& rhs) noexcept;
5 Postconditions: *this == rhs is true.
    [Note 2: *this and rhs share the ownership of the same stop state, if any. — end note]

    stop_source(stop_source&& rhs) noexcept;
6 Postconditions: *this contains the value of rhs prior to the start of construction and rhs.stop_possible() is false.

    ~stop_source();
7 Effects: Releases ownership of the stop state, if any.

    stop_source& operator=(const stop_source& rhs) noexcept;
8 Effects: Equivalent to: stop_source(rhs).swap(*this).
9 Returns: *this.

    stop_source& operator=(stop_source&& rhs) noexcept;
10 Effects: Equivalent to: stop_source(std::move(rhs)).swap(*this).
11 Returns: *this.

    void swap(stop_source& rhs) noexcept;

    Effects: Exchanges the values of *this and rhs.

33.3.4.3 Members

  [[nodiscard]] stop_token get_token() const noexcept;

    Returns: stop_token() if stop_possible() is false; otherwise a new associated stop_token object.

  [[nodiscard]] bool stop_possible() const noexcept;

    Returns: true if *this has ownership of a stop state; otherwise, false.

  [[nodiscard]] bool stop_requested() const noexcept;

    Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

bool request_stop() noexcept;

    Effects: If *this does not have ownership of a stop state, returns false. Otherwise, atomically determines whether the owned stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request are an atomic read-modify-write operation (6.9.2.2). If the request was made, the callbacks registered by associated stop_callback objects are synchronously called. If an invocation of a callback exits via an exception then terminate is invoked (14.6.2).

    [Note 1: A stop request includes notifying all condition variables of type condition_variable_any temporarily registered during an interruptible wait (33.7.5.3). — end note]

    Postconditions: stop_possible() is false or stop_requested() is true.

    Returns: true if this call made a stop request; otherwise false.

33.3.4.4 Non-member functions

  [[nodiscard]] friend bool

    operator==(const stop_source& lhs, const stop_source& rhs) noexcept;

    Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.

friend void swap(stop_source& x, stop_source& y) noexcept;

    Effects: Equivalent to: x.swap(y).

33.3.5 Class template stop_callback

33.3.5.1 General

namespace std {

    template<class Callback>
    class stop_callback {

    public:
        using callback_type = Callback;

        // 33.3.5.2, constructors and destructor

        template<class C>
            explicit stop_callback(const stop_token& st, C&& cb)
                noexcept(in_nothrow_constructible_v<Callback, C>);

        template<class C>
            explicit stop_callback(stop_token&& st, C&& cb)
                noexcept(in_nothrow_constructible_v<Callback, C>);

    -stop_callback();

        stop_callback(const stop_callback&) = delete;
        stop_callback(stop_callback&&) = delete;
        stop_callback& operator=(const stop_callback&) = delete;
        stop_callback& operator=(stop_callback&&) = delete;

§ 33.3.5.1
private:
  Callback callback;  // exposition only
};

template<class Callback>
stop_callback(stop_token, Callback) -> stop_callback<Callback>;
}

2 Mandates: stop_callback is instantiated with an argument for the template parameter Callback that satisfies both invocable and destructible.

3 Preconditions: stop_callback is instantiated with an argument for the template parameter Callback that models both invocable and destructible.

### 33.3.5.2 Constructors and destructor [stopcallback.cons]

```cpp
template<class C>
explicit stop_callback(const stop_token& st, C&& cb)
  noexcept(is_nothrow_constructible_v<Callback, C>);

explicit stop_callback(stop_token&& st, C&& cb)
  noexcept(is_nothrow_constructible_v<Callback, C>);
```

1 Constraints: Callback and C satisfy constructible_from<Callback, C>.

2 Preconditions: Callback and C model constructible_from<Callback, C>.

3 Effects: Initializes callback with std::forward<C>(cb). If st.stop_requested() is true, then std::forward<Callback>(callback)() is evaluated in the current thread before the constructor returns. Otherwise, if st has ownership of a stop state, acquires shared ownership of that stop state and registers the callback with that stop state such that std::forward<Callback>(callback)() is evaluated by the first call to request_stop() on an associated stop_source.

4 Throws: Any exception thrown by the initialization of callback.

5 Remarks: If evaluating std::forward<Callback>(callback) () exits via an exception, then terminate is invoked (14.6.2).

- stop_callback();

6 Effects: Unregisters the callback from the owned stop state, if any. The destructor does not block waiting for the execution of another callback registered by an associated stop_callback. If callback is concurrently executing on another thread, then the return from the invocation of callback strongly happens before (6.9.2.2) callback is destroyed. If callback is executing on the current thread, then the destructor does not block (3.7) waiting for the return from the invocation of callback. Releases ownership of the stop state, if any.

### 33.4 Threads [thread.threads]

#### 33.4.1 General [thread.threads.general]

33.4 describes components that can be used to create and manage threads.

[Note 1: These threads are intended to map one-to-one with operating system threads. — end note]

#### 33.4.2 Header <thread> synopsis [thread.syn]

```cpp
#include <compare>  // see 17.11.1

namespace std {

  // 33.4.3, class thread
class thread;

  void swap(thread& x, thread& y) noexcept;

  // 33.4.4, class jthread
class jthread;
```

§ 33.4.2
// 33.4.5, namespace this_thread
namespace this_thread {
    thread::id get_id() noexcept;

    void yield() noexcept;
    template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}

33.4.3 Class thread
33.4.3.1 General

The class thread provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A thread object uniquely represents a particular thread of execution. That representation may be transferred to other thread objects in such a way that no two thread objects simultaneously represent the same thread of execution. A thread of execution is detached when no thread object represents that thread. Objects of class thread can be in a state that does not represent a thread of execution.

[Note 1: A thread object does not represent a thread of execution after default construction, after being moved from, or after a successful call to detach or join. — end note]

namespace std {
    class thread {
    public:
        // 33.4.3.2, class thread::id
        class id;
        using native_handle_type = implementation-defined; // see 33.2.3

        // construct/copy/destroy
        thread() noexcept;
        template<class F, class... Args> explicit thread(F&& f, Args&&... args);
        ~thread();
        thread(const thread&) = delete;
        thread(thread&&) noexcept;
        thread& operator=(const thread&) = delete;
        thread& operator=(thread&&) noexcept;

        // 33.4.3.6, members
        void swap(thread&) noexcept;
        bool joinable() const noexcept;
        void join();
        void detach();
        id get_id() const noexcept;
        native_handle_type native_handle(); // see 33.2.3

        // static members
        static unsigned int hardware_concurrency() noexcept;
    };
}

33.4.3.2 Class thread::id

namespace std {
    class thread::id {
    public:
        id() noexcept;
    };

    bool operator==(thread::id x, thread::id y) noexcept;
    strong_ordering operator<=(thread::id x, thread::id y) noexcept;
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& out, thread::id id);

template<class charT> struct formatter<thread::id, charT>;

    // hash support
    template<class T> struct hash;
    template<> struct hash<thread::id>;

}  

1 An object of type thread::id provides a unique identifier for each thread of execution and a single distinct value for all thread objects that do not represent a thread of execution (33.4.3). Each thread of execution has an associated thread::id object that is not equal to the thread::id object of any other thread of execution and that is not equal to the thread::id object of any thread object that does not represent threads of execution.

2 The text representation for the character type charT of an object of type thread::id is an unspecified sequence of charT such that, for two objects of type thread::id x and y, if x == y is true, the thread::id objects have the same text representation, and if x != y is true, the thread::id objects have distinct text representations.

3 thread::id is a trivially copyable class (11.2). The library may reuse the value of a thread::id of a terminated thread that can no longer be joined.

4 [Note 1: Relational operators allow thread::id objects to be used as keys in associative containers. — end note]

    id() noexcept;

5 Postconditions: The constructed object does not represent a thread of execution.

    bool operator==(thread::id x, thread::id y) noexcept;

6 Returns: true only if x and y represent the same thread of execution or neither x nor y represents a thread of execution.

    strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

7 Let P(x, y) be an unspecified total ordering over thread::id as described in 27.8.

8 Returns: strong_ordering::less if P(x, y) is true. Otherwise, strong_ordering::greater if P(y, x) is true. Otherwise, strong_ordering::equal.

9 template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& out, thread::id id);

10 Effects: Inserts the text representation for charT of id into out.

11 template<class charT> struct formatter<thread::id, charT>;

12 formatter<thread::id, charT> interprets format-spec as a thread-id-format-spec. The syntax of format specifications is as follows:

thread-id-format-spec:
    fill-and-align_opt width_opt

[Note 2: The productions fill-and-align and width are described in 22.14.2.2. — end note]

13 If the align option is omitted it defaults to >.

14 A thread::id object is formatted by writing its text representation for charT to the output with additional padding and adjustments as specified by the format specifiers.

15 The specialization is enabled (22.10.19).
33.4.3.3 Constructors

thread() noexcept;

Effects: The object does not represent a thread of execution.
Postconditions: get_id() == id().

template<class F, class... Args> explicit thread(F&& f, Args&&... args);

Constraints: remove_cvref_t<F> is not the same type as thread.

Mandates: The following are all true:
(4.1) — is_constructible_v<decay_t<F>, F>,
(4.2) — (is_constructible_v<decay_t<Args>, Args> && ...), and
(4.3) — is_invocable_v<decay_t<F>, decay_t<Args>...>.

Effects: The new thread of execution executes
invoke(auto(std::forward<F>(f)), // for invoke, see 22.10.5
auto(std::forward<Args>(args))...)
with the values produced by auto being materialized (7.3.5) in the constructing thread. Any return
value from this invocation is ignored.

[Note 1: This implies that any exceptions not thrown from the invocation of the copy of f will be thrown in
the constructing thread, not the new thread. — end note]

If the invocation of invoke terminates with an uncaught exception, terminate is invoked (14.6.2).

Synchronization: The completion of the invocation of the constructor synchronizes with the beginning
of the invocation of the copy of f.

Postconditions: get_id() != id(). *this represents the newly started thread.

Throws: system_error if unable to start the new thread.

Error conditions:
(9.1) — resource_unavailable_try_again — the system lacked the necessary resources to create another
thread, or the system-imposed limit on the number of threads in a process would be exceeded.

thread(thread&& x) noexcept;

Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the start
of construction.

33.4.3.4 Destructor

~thread();

Effects: If joinable(), invokes terminate (14.6.2). Otherwise, has no effects.

[Note 1: Either implicitly detaching or joining a joinable() thread in its destructor can result in difficult to
debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown.
These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable.
— end note]

33.4.3.5 Assignment

thread& operator=(thread&& x) noexcept;

Effects: If joinable(), invokes terminate (14.6.2). Otherwise, assigns the state of x to *this and
sets x to a default constructed state.

Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the
assignment.

Returns: *this.

33.4.3.6 Members

void swap(thread& x) noexcept;

Effects: Swaps the state of *this and x.
bool joinable() const noexcept;

Returns: get_id() != id().

void join();

Effects: Blocks until the thread represented by *this has completed.

Synchronization: The completion of the thread represented by *this synchronizes with (6.9.2) the corresponding successful join() return.

[Note 1: Operations on *this are not synchronized. —end note]

Postconditions: The thread represented by *this has completed. get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

— resource_deadlock_would_occur — if deadlock is detected or get_id() == this_thread::get_id().

— no_such_process — if the thread is not valid.

— invalid_argument — if the thread is not joinable.

void detach();

Effects: The thread represented by *this continues execution without the calling thread blocking. When detach() returns, *this no longer represents the possibly continuing thread of execution. When the thread previously represented by *this ends execution, the implementation releases any owned resources.

Postconditions: get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

— no_such_process — if the thread is not valid.

— invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

Returns: A default constructed id object if *this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by *this.

33.4.3.7 Static members

unsigned hardware_concurrency() noexcept;

Returns: The number of hardware thread contexts.

[Note 1: This value should only be considered to be a hint. —end note]

If this value is not computable or well-defined, an implementation should return 0.

33.4.3.8 Specialized algorithms

void swap(thread& x, thread& y) noexcept;

Effects: As if by x.swap(y).

33.4.4 Class jthread

33.4.4.1 General

The class jthread provides a mechanism to create a new thread of execution. The functionality is the same as for class thread (33.4.3) with the additional abilities to provide a stop_token (33.3) to the new thread of execution, make stop requests, and automatically join.

namespace std {
    class jthread {
    public:
        // types
        using id = thread::id;
        using native_handle_type = thread::native_handle_type;

§ 33.4.4.1
33.4.4.2 Constructors, move, and assignment

jthread() noexcept;
template<class F, class... Args> explicit jthread(F&& f, Args&&... args);
~jthread();
jthread(const jthread&) = delete;
jthread(jthread&&) noexcept;
jthread& operator=(const jthread&) = delete;
jthread& operator=(jthread&&) noexcept;

33.4.4.3 Members

void swap(jthread&) noexcept;
[[nodiscard]] bool joinable() const noexcept;
void join();
void detach();
[[nodiscard]] id get_id() const noexcept;
[[nodiscard]] native_handle_type native_handle();  // see 33.2.3

33.4.4.4 Stop token handling

[[nodiscard]] stop_source get_stop_source() noexcept;
[[nodiscard]] stop_token get_stop_token() const noexcept;
bool request_stop() noexcept;

33.4.4.5 Specialized algorithms

friend void swap(jthread& lhs, jthread& rhs) noexcept;

33.4.4.6 Static members

[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

private:
stop_source ssource;  // exposition only
};

33.4.4.2 Constructors, move, and assignment

jthread() noexcept;

Effects: Constructs a jthread object that does not represent a thread of execution.

Postconditions: get_id() == id() is true and ssource.stop_possible() is false.

template<class F, class... Args> explicit jthread(F&& f, Args&&... args);

Constraints: remove_cvref_t< F > is not the same type as jthread.

Mandates: The following are all true:

(4.1) — is_constructible_v< decay_t<F>, F >,
(4.2) — (is_constructible_v< decay_t< Args >, Args & & ... >), and
(4.3) — is_invocable_v< decay_t<F>, decay_t< Args >..., stop_token, decay_t< Args >... >.

Effects: Initializes ssource. The new thread of execution executes

invoke(auto(std::forward<F>(f)), get_stop_token(), // for invoke, see 22.10.5
    auto(std::forward<Args>(args))...)

if that expression is well-formed, otherwise

invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)

with the values produced by auto being materialized (7.3.5) in the constructing thread. Any return
value from this invocation is ignored.

[Note 1: This implies that any exceptions not thrown from the invocation of the copy of f will be thrown in
the constructing thread, not the new thread. — end note]

If the invoke expression exits via an exception, terminate is called.
Synchronization: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of \( f \).

Postconditions: \( \text{get\_id()} \neq \text{id()} \) is true and \( \text{ssource\_stop\_possible()} \) is true and \(*\text{this}\) represents the newly started thread.

[Note 2: The calling thread can make a stop request only once, because it cannot replace this stop token. — end note]

Throws: \text{system\_error} if unable to start the new thread.

Error conditions:

1. \text{resource\_unavailable\_try\_again} — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

\( \text{j\_thread(j\_thread&& x)} \) noexcept;

Postconditions: \( x.\text{get\_id()} == \text{id()} \) and \( \text{get\_id()} \) returns the value of \( x.\text{get\_id()} \) prior to the start of construction. \text{ssource} has the value of \( x.\text{ssource} \) prior to the start of construction and \( x.\text{ssource\_stop\_possible()} \) is false.

\( \sim \text{j\_thread();} \)

Effects: If \( \text{joinable()} \) is true, calls \text{request\_stop()} and then \text{join()}.

[Note 3: Operations on \(*\text{this}\) are not synchronized. — end note]

\( \text{j\_thread\& operator=(j\_thread\&\& x)} \) noexcept;

Effects: If \&\& \( x \equiv \text{this} \) is true, there are no effects. Otherwise, if \( \text{joinable()} \) is true, calls \text{request\_-\_stop()} and then \text{join()}, then assigns the state of \( x \) to \(*\text{this}\) and sets \( x \) to a default constructed state.

Postconditions: \( \text{get\_id()} \) returns the value of \( x.\text{get\_id()} \) prior to the assignment. \text{ssource} has the value of \( x.\text{ssource} \) prior to the assignment.

Returns: \(*\text{this}\.\)

### 33.4.4.3 Members

\text{void swap(j\_thread\& x)} \) noexcept;

Effects: Exchanges the values of \(*\text{this}\) and \( x \).

[[\text{nodiscard}]] \text{bool joinable()} \) const noexcept;

Returns: \( \text{get\_id()} \neq \text{id()} \).

\text{void join();}

Effects: Blocks until the thread represented by \(*\text{this}\) has completed.

Synchronization: The completion of the thread represented by \(*\text{this}\) synchronizes with \( (6.9.2) \) the corresponding successful \text{join()} return.

[Note 1: Operations on \(*\text{this}\) are not synchronized. — end note]

Postconditions: The thread represented by \(*\text{this}\) has completed. \( \text{get\_id()} == \text{id()} \).

Throws: \text{system\_error} when an exception is required \( (33.2.2) \).

Error conditions:

1. \text{resource\_deadlock\_would\_occur} — if deadlock is detected or \( \text{get\_id()} == \text{this\_thread::get\_id()} \).
2. \text{no\_such\_process} — if the thread is not valid.
3. \text{invalid\_argument} — if the thread is not joinable.

\text{void detach();}

Effects: The thread represented by \(*\text{this}\) continues execution without the calling thread blocking. When \text{detach()} returns, \(*\text{this}\) no longer represents the possibly continuing thread of execution. When the thread previously represented by \(*\text{this}\) ends execution, the implementation releases any owned resources.

\( § \ 33.4.4.3 \) 1837
Postconditions: get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

— no_such_process — if the thread is not valid.
— invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

Returns: A default constructed id object if *this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by *this.

33.4.4.4 Stop token handling [thread.jthread.stop]

[[nodiscard]] stop_source get_stop_source() noexcept;

Effects: Equivalent to: return ssoure;

[[nodiscard]] stop_token get_stop_token() const noexcept;

Effects: Equivalent to: return ssoure.get_token();

bool request_stop() noexcept;

Effects: Equivalent to: return ssoure.request_stop();

33.4.4.5 Specialized algorithms [thread.jthread.special]

friend void swap(jthread& x, jthread& y) noexcept;

Effects: Equivalent to: x.swap(y).

33.4.4.6 Static members [thread.jthread.static]

[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

Returns: thread::hardware_concurrency().

33.4.5 Namespace this_thread [thread.thread.this]

namespace std::this_thread {

    thread::id get_id() noexcept;

    void yield() noexcept;

    template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);

    template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);

}

thread::id this_thread::get_id() noexcept;

Returns: An object of type thread::id that uniquely identifies the current thread of execution. Every invocation from this thread of execution returns the same value. The object returned does not compare equal to a default-constructed thread::id.

void this_thread::yield() noexcept;

Effects: Offers the implementation the opportunity to reschedule.

Synchronization: None.

template<class Clock, class Duration>
void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);

Effects: Blocks the calling thread for the absolute timeout (33.2.4) specified by abs_time.

Synchronization: None.

Throws: Timeout-related exceptions (33.2.4).
template<class Rep, class Period>

void sleep_for(const chrono::duration<Rep, Period>& rel_time);

Effects: Blocks the calling thread for the relative timeout (33.2.4) specified by rel_time.

Synchronization: None.

Throws: Timeout-related exceptions (33.2.4).

### 33.5 Atomic operations

#### 33.5.1 General

Subclause 33.5 describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

#### 33.5.2 Header `<atomic>` synopsis

```cpp
namespace std {
    // 33.5.4, order and consistency
    enum class memory_order : unspecified;  // freestanding
    inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;  // freestanding
    inline constexpr memory_order memory_order_consumer = memory_order::consume;  // freestanding
    inline constexpr memory_order memory_order_acquire = memory_order::acquire;  // freestanding
    inline constexpr memory_order memory_order_release = memory_order::release;  // freestanding
    inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;  // freestanding
    inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;  // freestanding

    template<class T>
        T kill_dependency(T y) noexcept;  // freestanding
}
```

}

§ 33.5.4 1843
The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

1. `memory_order::relaxed`: no operation orders memory.
2. `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
3. `memory_order::consume`: a load operation performs a consume operation on the affected memory location.
   
   [Note 1: Prefer `memory_order::acquire`, which provides stronger guarantees than `memory_order::consume`. Implementations have found it infeasible to provide performance better than that of `memory_order::acquire`. Specification revisions are under consideration. — end note]
4. `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

   [Note 2: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — end note]

An atomic operation $A$ that performs a release operation on an atomic object $M$ synchronizes with an atomic operation $B$ that performs an acquire operation on $M$ and takes its value from any side effect in the release sequence headed by $A$.

An atomic operation $A$ on some atomic object $M$ is coherence-ordered before another atomic operation $B$ on $M$ if

1. $A$ is a modification, and $B$ reads the value stored by $A$, or
2. $A$ precedes $B$ in the modification order of $M$, or
3. $A$ and $B$ are not the same atomic read-modify-write operation, and there exists an atomic modification $X$ of $M$ such that $A$ reads the value stored by $X$ and $X$ precedes $B$ in the modification order of $M$, or
4. there exists an atomic modification $X$ of $M$ such that $A$ is coherence-ordered before $X$ and $X$ is coherence-ordered before $B$.

There is a single total order $S$ on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if $A$ and $B$ are `memory_order::seq_cst` operations and $A$ strongly happens before $B$, then $A$ precedes $B$ in $S$. Second, for every pair of atomic operations $A$ and $B$ on an object $M$, where $A$ is coherence-ordered before $B$, the following four conditions are required to be satisfied by $S$:

1. if $A$ and $B$ are both `memory_order::seq_cst` operations, then $A$ precedes $B$ in $S$; and
2. if $A$ is a `memory_order::seq_cst` operation and $B$ happens before a `memory_order::seq_cst` fence $Y$, then $A$ precedes $Y$ in $S$; and
3. if a `memory_order::seq_cst` fence $X$ happens before $A$ and $B$ is a `memory_order::seq_cst` operation, then $X$ precedes $B$ in $S$; and
4. if a `memory_order::seq_cst` fence $X$ happens before $A$ and $B$ happens before a `memory_order::seq_cst` fence $Y$, then $X$ precedes $Y$ in $S$.

[Note 3: This definition ensures that $S$ is consistent with the modification order of any atomic object $M$. It also ensures that a `memory_order::seq_cst` load $A$ of $M$ gets its value either from the last modification of $M$ that precedes $A$ in $S$ or from some non-`memory_order::seq_cst` modification of $M$ that does not happen before any modification of $M$ that precedes $A$ in $S$. — end note]

[Note 4: We do not require that $S$ be consistent with “happens before” (6.9.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — end note]

[Note 5: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — end note]

Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[Note 6: For example, with $x$ and $y$ initially zero,
Thread 1:
r1 = y.load(memory_order::relaxed);
x.store(r1, memory_order::relaxed);

Thread 2:
r2 = x.load(memory_order::relaxed);
y.store(r2, memory_order::relaxed);

This recommendation discourages producing $r1 = r2 = 42$, since the store of 42 to $y$ is only possible if the store to $x$ stores 42, which circularly depends on the store to $y$ storing 42. Note that without this restriction, such an execution is possible. —end note]

—end note

9 [Note 7: The recommendation similarly disallows $r1 = r2 = 42$ in the following example, with $x$ and $y$ again initially zero:

Thread 1:
r1 = x.load(memory_order::relaxed);
if (r1 == 42) y.store(42, memory_order::relaxed);

Thread 2:
r2 = y.load(memory_order::relaxed);
if (r2 == 42) x.store(42, memory_order::relaxed);
—end note]

Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

10 Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

11 template<class T>
T kill_dependency(T y) noexcept;

12 Effects: The argument does not carry a dependency to the return value (6.9.2).

13 Returns: $y$.

33.5.5 Lock-free property [atomics.lockfree]

#define ATOMIC_BOOL_LOCK_FREE unspecified
#define ATOMIC_CHAR_LOCK_FREE unspecified
#define ATOMIC_CHAR8_T_LOCK_FREE unspecified
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified
#define ATOMIC_SHORT_LOCK_FREE unspecified
#define ATOMIC_INT_LOCK_FREE unspecified
#define ATOMIC_LONG_LOCK_FREE unspecified
#define ATOMIC_LLONG_LOCK_FREE unspecified
#define ATOMIC_POINTER_LOCK_FREE unspecified

1 The ATOMIC_..._LOCK_FREE macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the atomic template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

2 On a hosted implementation (16.4.2.5), at least one signed integral specialization of the atomic template, along with the specialization for the corresponding unsigned type (6.8.2), is always lock-free.

3 The functions atomic<T>::is_lock_free and atomic_is_lock_free (33.5.8.2) indicate whether the object is lock-free. In any given program execution, the result of the lock-free query is the same for all atomic objects of the same type.

4 Atomic operations that are not lock-free are considered to potentially block (6.9.2.3).

5 Recommended practice: Operations that are lock-free should also be address-free.

[Note 1: This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. —end note]

305 That is, atomic operations on the same memory location via two different addresses will communicate atomically.

§ 33.5.5 1845
33.5.6 Waiting and notifying

Atomic waiting operations and atomic notifying operations provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function’s effects.

[Note 1: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. — end note]

2 [Note 2: The following functions are atomic waiting operations:

\[(2.1)\) 
atomic\langle T\rangle::\text{wait},
\[(2.2)\) 
atomic\_flag::\text{wait},
\[(2.3)\) 
\text{atomic\_wait and atomic\_wait\_explicit},
\[(2.4)\) 
atomic\_flag\_wait and atomic\_flag\_wait\_explicit, and
\[(2.5)\) 
atomic\_ref\langle T\rangle::\text{wait}.

—end note]

3 [Note 3: The following functions are atomic notifying operations:

\[(3.1)\) 
atomic\langle T\rangle::\text{notify\_one and atomic\langle T\rangle::\text{notify\_all},
\[(3.2)\) 
atomic\_flag::\text{notify\_one and atomic\_flag::\text{notify\_all},
\[(3.3)\) 
\text{atomic\_notify\_one and atomic\_notify\_all},
\[(3.4)\) 
atomic\_flag\_notify\_one and atomic\_flag\_notify\_all, and
\[(3.5)\) 
atomic\_ref\langle T\rangle::\text{notify\_one and atomic\_ref\langle T\rangle::\text{notify\_all}.

—end note]

4 A call to an atomic waiting operation on an atomic object $M$ is eligible to be unblocked by a call to an atomic notifying operation on $M$ if there exist side effects $X$ and $Y$ on $M$ such that:

\[(4.1)\) 
the atomic waiting operation has blocked after observing the result of $X$,
\[(4.2)\) 
$X$ precedes $Y$ in the modification order of $M$, and
\[(4.3)\) 
$Y$ happens before the call to the atomic notifying operation.

33.5.7 Class template atomic\_ref

33.5.7.1 General

namespace std {

    template<class T> struct atomic\_ref {
        private:
            T* ptr; // exposition only

        public:
            using value\_type = T;
            static constexpr size\_t required\_alignment = implementation\_defined;
            static constexpr bool is\_always\_lock\_free = implementation\_defined;
            bool is\_lock\_free() const noexcept;
            explicit atomic\_ref(T&);
            atomic\_ref(const atomic\_ref&\) noexcept;
            atomic\_ref& operator=(const atomic\_ref&\) = delete;

            void store(T, memory\_order = memory\_order::seq\_cst) const noexcept;
            T operator=(T) const noexcept;
            T load(memory\_order = memory\_order::seq\_cst) const noexcept;
            operator T() const noexcept;
            T exchange(T, memory\_order = memory\_order::seq\_cst) const noexcept;
            bool compare\_exchange\_weak(T, T,
                memory\_order, memory\_order) const noexcept;
            bool compare\_exchange\_strong(T, T,
                memory\_order, memory\_order) const noexcept;

§ 33.5.7.1 1846
bool compare_exchange_weak(T& tgt, T& src, memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_strong(T& tgt, T& src, memory_order = memory_order::seq_cst) const noexcept;
void wait(T& tgt, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
}

1. An atomic_ref object applies atomic operations (33.5.1) to the object referenced by *ptr such that, for the lifetime (6.7.3) of the atomic_ref object, the object referenced by *ptr is an atomic object (6.9.2.2).
2. The program is ill-formed if is_trivially_copyable_v<T> is false.
3. The lifetime (6.7.3) of an object referenced by *ptr shall exceed the lifetime of all atomic_ref objects that reference the object. While any atomic_ref instances exist that reference the *ptr object, all accesses to that object shall exclusively occur through those atomic_ref instances. No subobject of the object referenced by atomic_ref shall be concurrently referenced by any other atomic_ref object.
4. Atomic operations applied to an object through a referencing atomic_ref are atomic with respect to atomic operations applied through any other atomic_ref referencing the same object. [Note 1: Atomic operations or the atomic_ref constructor can acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — end note]

33.5.7.2 Operations [atomics.ref.ops]

static constexpr size_t required_alignment;

1. The alignment required for an object to be referenced by an atomic reference, which is at least alignof(T).
2. [Note 1: Hardware could require an object referenced by an atomic_ref to have stricter alignment (6.7.6) than other objects of type T. Further, whether operations on an atomic_ref are lock-free could depend on the alignment of the referenced object. For example, lock-free operations on std::complex<double> could be supported only if aligned to 2*alignof(double). — end note]

static constexpr bool is_always_lock_free;

3. The static data member is_always_lock_free is true if the atomic_ref type's operations are always lock-free, and false otherwise.

bool is_lock_free() const noexcept;

4. Returns: true if operations on all objects of the type atomic_ref<T> are lock-free, false otherwise.

atomic_ref(T& obj);

5. Preconditions: The referenced object is aligned to required_alignment.
6. Postconditions: *this references obj.

atomic_ref(const atomic_ref& ref) noexcept;

8. Postconditions: *this references the object referenced by ref.

void store(T desired, memory_order order = memory_order::seq_cst) const noexcept;

9. Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.
10. Effects: Atomically replaces the value referenced by *ptr with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) const noexcept;

11. Effects: Equivalent to:
    store(desired);
    return desired;
T load(memory_order order = memory_order::seq_cst) const noexcept;

**Preconditions**: The order argument is neither memory_order::release nor memory_order::acq_rel.

**Effects**: Memory is affected according to the value of order.

**Returns**: Atomically returns the value referenced by *ptr.

operator T() const noexcept;

**Effects**: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) const noexcept;

**Effects**: Atomically replaces the value referenced by *ptr with desired. Memory is affected according to the value of order. This operation is an atomic read-modify-write operation (6.9.2).

**Returns**: Atomically returns the value referenced by *ptr immediately before the effects.

bool compare_exchange_weak(T& expected, T desired, memory_order success, memory_order failure) const noexcept;

bool compare_exchange_strong(T& expected, T desired, memory_order success, memory_order failure) const noexcept;

**Preconditions**: The failure argument is neither memory_order::release nor memory_order::acq_rel.

**Effects**: Retrieves the value in expected. It then atomically compares the value representation of the value referenced by *ptr for equality with that previously retrieved from expected, and if true, replaces the value referenced by *ptr with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value read from the value referenced by *ptr during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2.2) on the value referenced by *ptr. Otherwise, these operations are atomic load operations on that memory.

**Returns**: The result of the comparison.

**Remarks**: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and ptr are equal, it may return false and store back to expected the same memory contents that were originally there.

[Note 2: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;

**Preconditions**: order is neither memory_order::release nor memory_order::acq_rel.

**Effects**: Repeatedly performs the following steps, in order:

(21.1) Evaluates load(order) and compares its value representation for equality against that of old.

(21.2) If they compare unequal, returns.

(21.3) Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

**Remarks**: This function is an atomic waiting operation (33.5.6) on atomic object *ptr.
void notify_one() const noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation on *ptr that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6) on atomic object *ptr.

void notify_all() const noexcept;

Effects: Unblocks the execution of all atomic waiting operations on *ptr that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6) on atomic object *ptr.

33.5.7.3 Specializations for integral types [atomics.ref.int]

There are specializations of the atomic_ref class template for the integral types char, signed char, unsigned char, short, unsigned short, int, unsigned int, long, unsigned long, long long, unsigned long long, char8_t, char16_t, char32_t, wchar_t, and any other types needed by the typedefs in the header <cstdint> (17.4.1). For each such type integral-type, the specialization atomic_ref<integral-type> provides additional atomic operations appropriate to integral types.

[Note 1: The specialization atomic_ref<bool> uses the primary template (33.5.7). — end note]

namespace std {
    template<> struct atomic_ref<integral-type> {
        private:
            integral-type* ptr;  // exposition only
        
        public:
            using value_type = integral-type;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(integral-type&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(integral-type, memory_order = memory_order::seq_cst) const noexcept;
            integral-type operator=(integral-type) const noexcept;
            integral-type load(memory_order = memory_order::seq_cst) const noexcept;
            operator integral-type() const noexcept;
            integral-type exchange(integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(integral-type&, integral-type,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(integral-type&, integral-type,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(integral-type&, integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(integral-type&, integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_add(integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_sub(integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_and(integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_or(integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
            integral-type fetch_xor(integral-type,
                memory_order = memory_order::seq_cst) const noexcept;
    };
} // end namespace std

§ 33.5.7.3
integral-type operator++(int) const noexcept;
integral-type operator--(int) const noexcept;
integral-type operator++() const noexcept;
integral-type operator--() const noexcept;
integral-type operator+(integral-type) const noexcept;
integral-type operator-(integral-type) const noexcept;
integral-type operator&(integral-type) const noexcept;
integral-type operator^(integral-type) const noexcept;

void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;

Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 145.

integral-type fetch_key(integral-type operand,
memory_order order = memory_order::seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.2).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

integral-type operator op=(integral-type operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.7.4 Specializations for floating-point types

There are specializations of the atomic_ref class template for all cv-unqualified floating-point types. For each such type floating-point-type, the specialization atomic_ref<floating-point-type> provides additional atomic operations appropriate to floating-point types.

namespace std {
    template<> struct atomic_ref<floating-point-type> {
        private:
            floating-point-type* ptr;  // exposition only

        public:
            using value_type = floating-point-type;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;

            explicit atomic_ref(floating-point-type&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

            void store(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
            floating-point-type operator=(floating-point-type) const noexcept;
            floating-point-type load(memory_order = memory_order::seq_cst) const noexcept;
            operator floating-point-type() const noexcept;

    };
}
floating-point-type exchange(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_weak(floating-point-type&, floating-point-type, memory_order, memory_order) const noexcept;
bool compare_exchange_strong(floating-point-type&, floating-point-type, memory_order, memory_order) const noexcept;
bool compare_exchange_weak(floating-point-type&, floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_strong(floating-point-type&, floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
floating-point-type fetch_add(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
floating-point-type fetch_sub(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
floating-point-type operator+=(floating-point-type) const noexcept;
floating-point-type operator-=(floating-point-type) const noexcept;
void wait(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

2 Descriptions are provided below only for members that differ from the primary template.
3 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 145.

floating-point-type fetch_key(floating-point-type operand, memory_order order = memory_order::seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.2).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: If the result is not a representable value for its type (7.1), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point-type should conform to the std::numeric_limits<floating-point-type> traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point-type may be different than the calling thread’s floating-point environment.

floating-point-type operator op=(floating-point-type operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.7.5 Partial specialization for pointers [atomics.ref.pointer]

namespace std {
    template<class T> struct atomic_ref<T*> {
        private:
            T** ptr; // exposition only

        public:
            using value_type = T*;
            using difference_type = ptrdiff_t;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(T**);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;

        };

§ 33.5.7.5
void store(T*, memory_order = memory_order::seq_cst) const noexcept;
T* operator=(T*) const noexcept;
T* load(memory_order = memory_order::seq_cst) const noexcept;
operator T*() const noexcept;
T* exchange(T*, memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_weak(T*&, T*,
memory_order, memory_order) const noexcept;
bool compare_exchange_strong(T*&, T*,
memory_order, memory_order) const noexcept;
bool compare_exchange_weak(T*&, T*,
memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_strong(T*&, T*,
memory_order = memory_order::seq_cst) const noexcept;
T* fetch_add(difference_type, memory_order = memory_order::seq_cst) const noexcept;
T* fetch_sub(difference_type, memory_order = memory_order::seq_cst) const noexcept;
T* operator++(int) const noexcept;
T* operator--(int) const noexcept;
T* operator++() const noexcept;
T* operator--() const noexcept;

T* operator-=(difference_type) const noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

1 Descriptions are provided below only for members that differ from the primary template.
2 The following operations perform arithmetic computations. The correspondence among key, operator, and
computation is specified in Table 146.

T* fetch_key(difference_type operand, memory_order order = memory_order::seq_cst) const noexcept;

Mandates: T is a complete object type.

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied
to the value referenced by *ptr and the given operand. Memory is affected according to the value of
order. These operations are atomic read-modify-write operations (6.9.2.2).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: The result may be an undefined address, but the operations otherwise have no undefined
behavior.

T* operator op=(difference_type operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

value_type operator++(int) const noexcept;

Effects: Equivalent to: return fetch_add(1);

value_type operator--(int) const noexcept;

Effects: Equivalent to: return fetch_sub(1);

value_type operator++() const noexcept;

Effects: Equivalent to: return fetch_add(1) + 1;

value_type operator--() const noexcept;

Effects: Equivalent to: return fetch_sub(1) - 1;
33.5.8 Class template atomic

33.5.8.1 General

namespace std {
    template<class T> struct atomic {
        using value_type = T;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        // 33.5.8.2, operations on atomic types
        constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
        constexpr atomic(T) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        T load(memory_order = memory_order::seq_cst) const volatile noexcept;
        T load(memory_order = memory_order::seq_cst) const noexcept;
        operator T() const volatile noexcept;
        operator T() const noexcept;
        void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(T, memory_order = memory_order::seq_cst) noexcept;
        T operator=(T) volatile noexcept;
        T operator=(T) noexcept;
        T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
        T exchange(T, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
        bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
        bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;
        void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
        void wait(T, memory_order = memory_order::seq_cst) const noexcept;
        void notify_one() volatile noexcept;
        void notify_one() noexcept;
        void notify_all() volatile noexcept;
        void notify_all() noexcept;
    };
}

1 The template argument for T shall meet the Cpp17CopyConstructible and Cpp17CopyAssignable requirements. The program is ill-formed if any of

   (1.1) — is_trivially_copyable_v<T>,
   (1.2) — is_copy_constructible_v<T>,
   (1.3) — is_move_constructible_v<T>,
   (1.4) — is_copyAssignable_v<T>, or
   (1.5) — is_move_assignable_v<T>

   is false.

[Note 1: Type arguments that are not also statically initializable can be difficult to use. — end note]

2 The specialization atomic<bool> is a standard-layout struct.

3 [Note 2: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — end note]
33.5.8.2 Operations on atomic types

constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);

Mandates: is_default_constructible_v<T> is true.

Effects: Initializes the atomic object with the value of T(). Initialization is not an atomic operation (6.9.2).

constexpr atomic(T desired) noexcept;

Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

static constexpr bool is_always_lock_free = implementation-defined;

The static data member is_always_lock_free is true if the atomic type’s operations are always lock-free, and false otherwise.

[Note 2: The value of is_always_lock_free is consistent with the value of the corresponding ATOMIC_...-_LOCK_FREE macro, if defined. — end note]

bool is_lock_free() const volatile noexcept;
b00l is_lock_free() const noexcept;

Returns: true if the object’s operations are lock-free, false otherwise.

[Note 3: The return value of the is_lock_free member function is consistent with the value of is_always_lock_free for the same type. — end note]

void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
void store(T desired, memory_order order = memory_order::seq_cst) noexcpet;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

Effects: Atomically replaces the value pointed to by this with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to store(desired).

T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcpet;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Preconditions: The order argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns the value pointed to by this.

operator T() const volatile noexcept;
operator T() const noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcpet;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Atomically replaces the value pointed to by this with desired. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically returns the value pointed to by this immediately before the effects.

```c
bool compare_exchange_weak(T& expected, T desired,    
memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,    
memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,    
memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,    
memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,    
memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,    
memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,    
memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,    
memory_order order = memory_order::seq_cst) noexcept;
```

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Preconditions: The failure argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Retrieves the value in expected. It then atomically compares the value representation of the value pointed to by this for equality with that previously retrieved from expected, and if true, replaces the value pointed to by this with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value pointed to by this during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2) on the memory pointed to by this. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

[Note 4: For example, the effect of compare_exchange_strong on objects without padding bits (6.8.1) is]

```c
if (memcmp(this, &expected, sizeof(*this)) == 0)  
  memcpy(this, &desired, sizeof(*this));
else  
  memcpy(&expected, this, sizeof(*this));
—end note]
```

[Example 1: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update expected when another iteration of the loop is needed.]

```c
expected = current.load();
do {
  desired = function(expected);
} while (!current.compare_exchange_weak(expected, desired));
—end example]
```

[Example 2: Because the expected value is updated only on failure, code releasing the memory containing the expected value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:]

```c
do {
  p->next = head; // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p)); // try to insert
—end example]
```
Implementations should ensure that weak compare-and-exchange operations do not consistently return \textit{false} unless either the atomic object has value different from \texttt{expected} or there are concurrent modifications to the atomic object.

\textit{Remarks:} A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by \texttt{expected} and \texttt{this} are equal, it may return \textit{false} and store back to \texttt{expected} the same memory contents that were originally there.

\[ \text{Note 5:} \] This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. \textit{— end note} \[ \]

\[ \text{Note 6:} \] Under cases where the \texttt{memcpy} and \texttt{memcmp} semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with \texttt{operator==} if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point $-0.0$ and $+0.0$ will not compare equal with \texttt{memcmp} but will compare equal with \texttt{operator==}, and NaNs with the same payload will compare equal with \texttt{memcmp} but will not compare equal with \texttt{operator==}. \textit{— end note} \[ \]

\[ \text{Note 7:} \] Because compare-and-exchange acts on an object’s value representation, padding bits that never participate in the object’s value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:

\begin{verbatim}
struct padded {
  char clank = 0x42;
  // Padding here.
  unsigned biff = 0xCODEFEEF;
};
atomic<padded> pad = {};

bool zap() {
  padded expected, desired{0, 0};
  return pad.compare_exchange_strong(expected, desired);
}
\end{verbatim} \textit{— end note} \[ \]

\[ \text{Note 8:} \] For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

\begin{verbatim}
union pony {
  double celestia = 0.;
  short luna; // padded
};
atomic<pony> princesses = {};

bool party(pony desired) {
  pony expected;
  return princesses.compare_exchange_strong(expected, desired);
}
\end{verbatim} \textit{— end note} \[ \]

\noindent \textbf{§ 33.5.8.2 1856}

Preconditions: \textit{order} is neither \texttt{memory_order::release} nor \texttt{memory_order::acq_rel}.

\textbf{Effects:} Repeatedly performs the following steps, in order:

\begin{enumerate}
  \item Evaluates \texttt{load(order)} and compares its value representation for equality against that of \texttt{old}.
  \item If they compare unequal, returns.
  \item Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.
\end{enumerate}

\textit{Remarks:} This function is an atomic waiting operation (33.5.6).
void notify_one() volatile noexcept;
void notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

void notify_all() volatile noexcept;
void notify_all() noexcept;

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

33.5.8.3 Specializations for integers

There are specializations of the atomic class template for the integral types char, signed char, unsigned char, short, unsigned short, int, unsigned int, long, unsigned long, long long, char8_t, char16_t, char32_t, wchar_t, and any other types needed by the typedefs in the header <cstdint> (17.4.1). For each such type integral-type, the specialization atomic<integral-type> provides additional atomic operations appropriate to integral types.

[Note 1: The specialization atomic<bool> uses the primary template (33.5.8). — end note]

namespace std {
  template<> struct atomic<integral-type> {
    using value_type = integral-type;
    using difference_type = value_type;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const volatile noexcept;
    bool is_lock_free() const noexcept;

    constexpr atomic() noexcept;
    constexpr atomic(integral-type) noexcept;
    atomic(const atomic&) = delete;
    atomic& operator=(const atomic&) volatile = delete;

    void store(integral-type, memory_order = memory_order::seq_cst) volatile noexcept;
    void store(integral-type, memory_order = memory_order::seq_cst) noexcept;
    integral-type operator=(integral-type) volatile noexcept;
    integral-type operator=(integral-type) noexcept;
    integral-type load(memory_order = memory_order::seq_cst) const volatile noexcept;
    integral-type load(memory_order = memory_order::seq_cst) const noexcept;
    operator integral-type() const volatile noexcept;
    operator integral-type() const noexcept;

    integral-type exchange(integral-type,
      memory_order = memory_order::seq_cst) volatile noexcept;
    integral-type exchange(integral-type,
      memory_order = memory_order::seq_cst) noexcept;
    bool compare_exchange_weak(integral-type&, integral-type,
      memory_order, memory_order) volatile noexcept;
    bool compare_exchange_weak(integral-type&, integral-type,
      memory_order, memory_order) noexcept;
    bool compare_exchange_strong(integral-type&, integral-type,
      memory_order, memory_order) volatile noexcept;
    bool compare_exchange_strong(integral-type&, integral-type,
      memory_order, memory_order) noexcept;
    bool compare_exchange_weak(integral-type&, integral-type,
      memory_order = memory_order::seq_cst) volatile noexcept;
    bool compare_exchange_strong(integral-type&, integral-type,
      memory_order = memory_order::seq_cst) volatile noexcept;
  }
}
bool compare_exchange_strong(integral-type&, integral-type,
    memory_order = memory_order::seq_cst) noexcept;

integral-type fetch_add(integral-type,
    memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_add(integral-type,
    memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_sub(integral-type,
    memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_sub(integral-type,
    memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_and(integral-type,
    memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_and(integral-type,
    memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_or(integral-type,
    memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_or(integral-type,
    memory_order = memory_order::seq_cst) noexcept;
integral-type fetch_xor(integral-type,
    memory_order = memory_order::seq_cst) volatile noexcept;
integral-type fetch_xor(integral-type,
    memory_order = memory_order::seq_cst) noexcept;

integral-type operator++(int) volatile noexcept;
integral-type operator++(int) noexcept;
integral-type operator--(int) volatile noexcept;
integral-type operator--(int) noexcept;
integral-type operator++() volatile noexcept;
integral-type operator++() noexcept;
integral-type operator--() volatile noexcept;
integral-type operator--() noexcept;

integral-type operator+=(integral-type) volatile noexcept;
integral-type operator+=(integral-type) noexcept;
integral-type operator-=(integral-type) volatile noexcept;
integral-type operator-=(integral-type) noexcept;
integral-type operator&=(integral-type) volatile noexcept;
integral-type operator&=(integral-type) noexcept;
integral-type operator|=(integral-type) volatile noexcept;
integral-type operator|=(integral-type) noexcept;
integral-type operator^=(integral-type) volatile noexcept;
integral-type operator^=(integral-type) noexcept;

void wait(integral-type, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
}

The atomic integral specializations are standard-layout structs. They each have a trivial destructor.

Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 145.

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

6. **Effects:** Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

7. **Returns:** Atomically, the value pointed to by this immediately before the effects.

8. **Remarks:** For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

9. **Constraints:** For the volatile overload of this function, is_always_lock_free is true.

10. **Effects:** Equivalent to: return fetch_key(operand) op operand;

33.5.8.4 Specializations for floating-point types

There are specializations of the atomic class template for all cv-unqualified floating-point types. For each such type floating-point-type, the specialization atomic<floating-point-type> provides additional atomic operations appropriate to floating-point types.

```cpp
namespace std {
    template<> struct atomic<floating-point-type> {
        using value_type = floating-point-type;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(floating-point-type) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(floating-point-type, memory_order = memory_order::seq_cst) noexcept;
        floating-point-type operator=(floating-point-type) volatile noexcept;
        floating-point-type operator=(floating-point-type) noexcept;
        floating-point-type load(memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type load(memory_order = memory_order::seq_cst) noexcept;
        operator floating-point-type() volatile noexcept;
        operator floating-point-type() noexcept;

        floating-point-type exchange(floating-point-type,
                                      memory_order = memory_order::seq_cst) volatile noexcept;
        floating-point-type exchange(floating-point-type,
                                      memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                    memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                    memory_order, memory_order) noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                      memory_order, memory_order) volatile noexcept;
    };
}
```
bool compare_exchange_strong(floating-point-type&, floating-point-type, memory_order, memory_order) noexcept;
bool compare_exchange_weak(floating-point-type&, floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(floating-point-type&, floating-point-type, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(floating-point-type&, floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(floating-point-type&, floating-point-type, memory_order = memory_order::seq_cst) noexcept;

floating-point-type fetch_add(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
floating-point-type fetch_add(floating-point-type, memory_order = memory_order::seq_cst) noexcept;
floating-point-type fetch_sub(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
floating-point-type fetch_sub(floating-point-type, memory_order = memory_order::seq_cst) noexcept;

floating-point-type operator+=(floating-point-type) volatile noexcept;
floating-point-type operator+=(floating-point-type) noexcept;
floating-point-type operator-=(floating-point-type) volatile noexcept;
floating-point-type operator-=(floating-point-type) noexcept;

void wait(floating-point-type, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.
3 Descriptions are provided below only for members that differ from the primary template.
4 The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in Table 145.

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).
Returns: Atomically, the value pointed to by this immediately before the effects.
Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point-type should conform to the std::numeric_limits<floating-point-type> traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point-type may be different than the calling thread’s floating-point environment.

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_key(operand) op operand;
Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point-type should conform to the std::numeric_limits<floating-point-type> traits associated with the
floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point-type may be different than the calling thread’s floating-point environment.

33.5.8.5 Partial specialization for pointers

namespace std {
    template<class T> struct atomic<T*> {
        using value_type = T*;
        using difference_type = ptrdiff_t;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(T*) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;
        atomic& operator=(const atomic&) = delete;

        void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(T*, memory_order = memory_order::seq_cst) noexcept;
        T* operator=(T*) volatile noexcept;
        T* operator=(T*) noexcept;
        T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
        T* load(memory_order = memory_order::seq_cst) const noexcept;
        operator T*() const volatile noexcept;
        operator T*() const noexcept;

        T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(T*& t, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(T*& t, T*, memory_order, memory_order) noexcept;
        bool compare_exchange_strong(T*& t, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(T*& t, T*, memory_order, memory_order) noexcept;

        T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
        T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
        T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
        T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;

        T* operator++(int) volatile noexcept;
        T* operator++(int) noexcept;
        T* operator--(int) volatile noexcept;
        T* operator--(int) noexcept;
        T* operator++() volatile noexcept;
        T* operator++() noexcept;
        T* operator--() volatile noexcept;
        T* operator--() noexcept;
        T* operator+=(ptrdiff_t) volatile noexcept;
        T* operator+=(ptrdiff_t) noexcept;
        T* operator-=(ptrdiff_t) volatile noexcept;
        T* operator-=(ptrdiff_t) noexcept;

        void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
        void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
        void notify_one() volatile noexcept;
    }
}

§ 33.5.8.5 1861
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
}

1. There is a partial specialization of the atomic class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.

2. Descriptions are provided below only for members that differ from the primary template.

3. The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in Table 146.

<table>
<thead>
<tr>
<th>key</th>
<th>Op</th>
<th>Computation</th>

<tbody>
<tr>
<td>add</td>
<td>+</td>
<td>addition</td>
</tr>
<tr>
<td>sub</td>
<td>-</td>
<td>subtraction</td>
</tr>
</tbody>
</table>

T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;
4. Constraints: For the volatile overload of this function, is_always_lock_free is true.

5. Mandates: T is a complete object type.

6. Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

7. Returns: Atomically, the value pointed to by this immediately before the effects.

8. Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;
9. Constraints: For the volatile overload of this function, is_always_lock_free is true.

10. Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.8.6 Member operators common to integers and pointers to objectsmemop]

value_type operator++(int) volatile noexcept;
value_type operator++(int) noexcept;
1. Constraints: For the volatile overload of this function, is_always_lock_free is true.

2. Effects: Equivalent to: return fetch_add(1);

value_type operator--(int) volatile noexcept;
value_type operator--(int) noexcept;
3. Constraints: For the volatile overload of this function, is_always_lock_free is true.

4. Effects: Equivalent to: return fetch_sub(1);

value_type operator++() volatile noexcept;
value_type operator++() noexcept;
5. Constraints: For the volatile overload of this function, is_always_lock_free is true.

6. Effects: Equivalent to: return fetch_add(1) + 1;

value_type operator--() volatile noexcept;
value_type operator--() noexcept;
7. Constraints: For the volatile overload of this function, is_always_lock_free is true.

8. Effects: Equivalent to: return fetch_sub(1) - 1;
33.5.8.7 Partial specializations for smart pointers [util.smartptr.atomic]

33.5.8.7.1 General [util.smartptr.atomic.general]

1 The library provides partial specializations of the `atomic` template for shared-ownership smart pointers (20.3.2).

[Note 1: The partial specializations are declared in header `<memory>` (20.2.2). — end note]

The behavior of all operations is as specified in 33.5.8, unless specified otherwise. The template parameter `T` of these partial specializations may be an incomplete type.

2 All changes to an atomic smart pointer in 33.5.8.7, and all associated `use_count` increments, are guaranteed to be performed atomically. Associated `use_count` decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[Note 2: If the atomic operation uses locks, locks acquired by the implementation will be held when any `use_count` adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — end note]

3 [Example 1:

```cpp
template<typename T> class atomic_list {
    struct node {
        T t;
        shared_ptr<node> next;
    };
    atomic<shared_ptr<node>> head;

    public:
    shared_ptr<node> find(T t) const {
        auto p = head.load();
        while (p && p->t != t)
            p = p->next;
        return p;
    }

    void push_front(T t) {
        auto p = make_shared<node>();
        p->t = t;
        p->next = head;
        while (!head.compare_exchange_weak(p->next, p)) {}}
    }
};
```

—end example]

33.5.8.7.2 Partial specialization for `shared_ptr` [util.smartptr.atomic.shared]

namespace std {

template<
    class T
>
struct atomic<
    shared_ptr<T>
> {
    using value_type = shared_ptr<T>;

    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;

    constexpr atomic() noexcept;
    constexpr atomic(nullptr_t) noexcept : atomic() {};
    atomic(const atomic&) = delete;
    void operator=(const atomic&) = delete;

    shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
    operator shared_ptr<T>() const noexcept;
    void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
    void operator=(shared_ptr<T> desired) noexcept;
    void operator=(nullptr_t) noexcept;

};

§ 33.5.8.7.2 1863
shared_ptr<T> exchange(shared_ptr<T> desired,
    memory_order order = memory_order::seq_cst) noexcept;

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
    memory_order success, memory_order failure) noexcept;

bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
    memory_order success, memory_order failure) noexcept;

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
    memory_order order = memory_order::seq_cst) noexcept;

bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
    memory_order order = memory_order::seq_cst) noexcept;

void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

void notify_one() noexcept;

void notify_all() noexcept;

private:
    shared_ptr<T> p;  // exposition only
};

constexpr atomic() noexcept;

atomic(shared_ptr<T> desired) noexcept;

Effects: Initializes p().

atomic(shared_ptr<T> desired) noexcept;

Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Preconditions: order is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

Effects: Atomically replaces the value pointed to by this with the value of desired as if by p.swap(desired). Memory is affected according to the value of order.

void operator=(shared_ptr<T> desired) noexcept;

Effects: Equivalent to store(desired).

void operator=(nullptr_t) noexcept;

Effects: Equivalent to store(nullptr).

shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns p.

operator shared_ptr<T>() const noexcept;

Effects: Equivalent to: return load();

shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2.2).

Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
    memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
memory_order success, memory_order failure) noexcept;

Preconditions: failure is neither memory_order::release nor memory_order::acq_rel.

Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

Returns: true if p was equivalent to expected, false otherwise.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:
return compare_exchange_weak(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:
return compare_exchange_strong(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

(21.1) — Evaluates load(order) and compares it to old.
(21.2) — If the two are not equivalent, returns.
(21.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

void notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

void notify_all() noexcept;

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

33.5.8.7.3 Partial specialization for weak_ptr

namespace std {
template<class T> struct atomic<weak_ptr<T>> {
    using value_type = weak_ptr<T>;
    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;
    constexpr atomic() noexcept;
    atomic(weak_ptr<T> desired) noexcept;
    atomic(const atomic&) = delete;
    void operator=(const atomic&) = delete;
    weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
    operator weak_ptr<T>() const noexcept;
    void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
    void operator=(weak_ptr<T> desired) noexcept;
    weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
    bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order success, memory_order failure) noexcept;
    bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order success, memory_order failure) noexcept;
    void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
    void notify_one() noexcept;
    void notify_all() noexcept;

private:
    weak_ptr<T> p; // exposition only
};

constexpr atomic() noexcept;
atomic(weak_ptr<T> desired) noexcept;

Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. —end note]

void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

 Preconditions: order is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.
Effects: Atomically replaces the value pointed to by this with the value of desired as if by p.swap(desired). Memory is affected according to the value of order.

void operator=(weak_ptr<T> desired) noexcept;

Effects: Equivalent to store(desired).

weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;

 Preconditions: order is neither memory_order::release nor memory_order::acq_rel.
Effects: Memory is affected according to the value of order.

Returns: Atomically returns p.
operator weak_ptr<T>() const noexcept;

Effects: Equivalent to: return load();

weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2.2).

Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
memory_order success, memory_order failure) noexcept;

Preconditions: failure is neither memory_order::release nor memory_order::acq_rel.

Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

Returns: true if p was equivalent to expected, false otherwise.

Remarks: Two weak_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_weak(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_strong(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

(20.1) — Evaluates load(order) and compares it to old.

(20.2) — If the two are not equivalent, returns.

(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: Two weak_ptr objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

void notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.
Remarks: This function is an atomic notifying operation (33.5.6).

```c
void notify_all() noexcept;
```

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

### 33.5.9 Non-member functions

A non-member function template whose name matches the pattern `atomic_f` or the pattern `atomic_f_explicit` invokes the member function `f`, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.

[Note 1: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — end note]

#### 33.5.10 Flag type and operations

```c
namespace std {
    struct atomic_flag {
        constexpr atomic_flag() noexcept;
        atomic_flag(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag& volatile) = delete;

        bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
        bool test(memory_order = memory_order::seq_cst) const noexcept;
        bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
        bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
        void clear(memory_order = memory_order::seq_cst) volatile noexcept;
        void clear(memory_order = memory_order::seq_cst) noexcept;
        void notify_one() volatile noexcept;
        void notify_one() noexcept;
        void notify_all() volatile noexcept;
        void notify_all() noexcept;
    };
}
```

The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.

Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free.

The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

```c
constexpr atomic_flag::atomic_flag() noexcept;
```

**Effects:** Initializes `*this` to the clear state.

```c
bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object,
                               memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcep;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcep;
```

For `atomic_flag_test`, let `order` be `memory_order::seq_cst`.

** Preconditions:** `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

** Effects:** Memory is affected according to the value of `order`.

** Returns:** Atomically returns the value pointed to by `object` or `this`. 

§ 33.5.10
bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically sets the value pointed to by object or by this to true. Memory is affected
according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value of the object immediately before the effects.

void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;

Preconditions: The order argument is neither memory_order::consume, memory_order::acquire,
or memory_order::acq_rel.

Effects: Atomically sets the value pointed to by object or by this to false. Memory is affected
according to the value of order.

void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const noexcept;

For atomic_flag_wait, let order be memory_order::seq_cst. Let flag be object for the non-
member functions and this for the member functions.

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:
(15.1) Evaluates flag->test(order) != old.
(15.2) If the result of that evaluation is true, returns.
(15.3) Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: This function is an atomic waiting operation (33.5.6).

void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked
(33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6)
by this call.

Remarks: This function is an atomic notifying operation (33.5.6).
#define ATOMIC_FLAG_INIT see below

Remarks: The macro ATOMIC_FLAG_INIT is defined in such a way that it can be used to initialize an object of type atomic_flag to the clear state. The macro can be used in the form:

\[\text{atomic_flag guard} = \text{ATOMIC_FLAG_INIT};\]

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

33.5.11 Fences

This subclause introduces synchronization primitives called fences. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an acquire fence. A fence with release semantics is called a release fence.

A release fence \(A\) synchronizes with an acquire fence \(B\) if there exist atomic operations \(X\) and \(Y\), both operating on some atomic object \(M\), such that \(A\) is sequenced before \(X\), \(X\) modifies \(M\), \(Y\) is sequenced before \(B\), and \(Y\) reads the value written by \(X\) or a value written by any side effect in the hypothetical release sequence \(X\) would head if it were a release operation.

A release fence \(A\) synchronizes with an atomic operation \(B\) that performs an acquire operation on an atomic object \(M\) if there exists an atomic operation \(X\) such that \(A\) is sequenced before \(X\), \(X\) modifies \(M\), and \(B\) reads the value written by \(X\) or a value written by any side effect in the hypothetical release sequence \(X\) would head if it were a release operation.

An atomic operation \(A\) that is a release operation on an atomic object \(M\) synchronizes with an acquire fence \(B\) if there exists some atomic operation \(X\) on \(M\) such that \(X\) is sequenced before \(B\) and reads the value written by \(A\) or a value written by any side effect in the release sequence headed by \(A\).

```c
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

Effects: Depending on the value of \(order\), this operation:

1. has no effects, if \(order == \text{memory_order::relaxed}\);
2. is an acquire fence, if \(order == \text{memory_order::acquire}\) or \(order == \text{memory_order::consume}\);
3. is a release fence, if \(order == \text{memory_order::release}\);
4. is both an acquire fence and a release fence, if \(order == \text{memory_order::acq_rel}\);
5. is a sequentially consistent acquire and release fence, if \(order == \text{memory_order::seq_cst}\).

```c
extern "C" void atomic_signal_fence(memory_order order) noexcept;
```

Effects: Equivalent to \(\text{atomic_thread_fence(order)}\), except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

[Note 1: \text{atomic_signal_fence} can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with \text{atomic_thread_fence}, but the hardware fence instructions that \text{atomic_thread_fence} would have inserted are not emitted. —end note]

33.5.12 C compatibility

The header \(<\text{stdatomic.h}>\) provides the following definitions:

```c
template<class T>
using std-atomic = std::atomic<T>; // exposition only
```

#define _Atomic(T) std-atomic<T>

1 Each using-declaration for some name A in the synopsis above makes available the same entity as std::A declared in <atomic> (33.5.2). Each macro listed above other than _Atomic(T) is defined as in <atomic>. It is unspecified whether <stdatomic.h> makes available any declarations in namespace std.

2 Each of the using-declarations for int N_t, uint N_t, intptr_t, and uintptr_t listed above is defined if and only if the implementation defines the corresponding typedef-name in 33.5.2.

3 Neither the _Atomic macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than <stdatomic.h>.

4 Recommended practice: Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an _Atomic(T) from C code and an atomic<T> from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.

### 33.6 Mutual exclusion
#### 33.6.1 General

Subclause 33.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

#### 33.6.2 Header <mutex> synopsis

namespace std {
  // 33.6.4.2.2, class mutex
  class mutex;
  // 33.6.4.2.3, class recursive_mutex
  class recursive_mutex;
  // 33.6.4.3.2 class timed_mutex
  class timed_mutex;
  // 33.6.4.3.3, class recursive_timed_mutex
  class recursive_timed_mutex;

  struct defer_lock_t { explicit defer_lock_t() = default; };
  struct try_to_lock_t { explicit try_to_lock_t() = default; };
  struct adopt_lock_t { explicit adopt_lock_t() = default; };

  inline constexpr defer_lock_t defer_lock();
  inline constexpr try_to_lock_t try_to_lock();
  inline constexpr adopt_lock_t adopt_lock();
}
// 33.6.5, locks

33.6.3 Header <shared_mutex> synopsis

namespace std {
  // 33.6.4.4.2, class shared_mutex
  class shared_mutex;
  // 33.6.4.5.2, class shared_timed_mutex
  class shared_timed_mutex;
  // 33.6.5.5, class template shared_lock
  template<class Mutex> class shared_lock;
  template<class Mutex>
  void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}

33.6.4 Mutex requirements

33.6.4.1 In general

1 A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (33.2.5). An execution agent owns a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

33.6.4.2 Mutex types

1 The mutex types are the standard library types mutex, recursive_mutex, timed_mutex, recursive_timed_mutex, shared_mutex, and shared_timed_mutex. They meet the requirements set out in 33.6.4.2. In this description, m denotes an object of a mutex type.

[Note 1: The mutex types meet the Cpp17Lockable requirements (33.2.5.3). — end note]

2 The mutex types meet Cpp17DefaultConstructible and Cpp17Destructible. If initialization of an object of a mutex type fails, an exception of type system_error is thrown. The mutex types are neither copyable nor movable.

[Note 3: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads. — end note]
The expression `m.lock()` is well-formed and has the following semantics:

**Preconditions**: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

**Effects**: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

**Synchronization**: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

**Postconditions**: The calling thread owns the mutex.

**Return type**: `void`.

**Throws**: `system_error` when an exception is required (33.2.2).

**Error conditions**:
- `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

The expression `m.try_lock()` is well-formed and has the following semantics:

**Preconditions**: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

**Effects**: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

[Note 4: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (33.5). — end note]

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

**Synchronization**: If `try_lock()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

[Note 5: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — end note]

**Return type**: `bool`.

**Returns**: `true` if ownership was obtained, otherwise `false`.

**Throws**: Nothing.

The expression `m.unlock()` is well-formed and has the following semantics:

**Preconditions**: The calling thread owns the mutex.

**Effects**: Releases the calling thread’s ownership of the mutex.

**Return type**: `void`.

**Synchronization**: This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

**Throws**: Nothing.

### 33.6.4.2.2 Class mutex

```
namespace std {
    class mutex {
        public:
            constexpr mutex() noexcept;
            ~mutex();
            mutex(const mutex&) = delete;
            mutex& operator=(const mutex&) = delete;
            void lock();
            bool try_lock();
            void unlock();
    }
}
```

§ 33.6.4.2.2
using native_handle_type = implementation-defined; // see 33.2.3
native_handle_type native_handle(); // see 33.2.3
}

The class `mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the owning thread has released ownership with a call to `unlock()`. 

**Note 1:** After a thread A has called `unlock()`, releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread A doesn’t access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — end note

The class `mutex` meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).

A thread that owns a `recursive_mutex` object may acquire additional levels of ownership by calling `lock()` or `try_lock()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.

The behavior of a program is undefined if:

1. it destroys a `recursive_mutex` object owned by any thread or
2. a thread terminates while owning a `recursive_mutex` object.

---

**33.6.4.3 Timed mutex types**

**33.6.4.3.1 General**

The `timed_mutex` types are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They meet the requirements set out below. In this description, m denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).
The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:

**Preconditions:** If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

**Effects:** The function attempts to obtain ownership of the mutex within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

**Synchronization:** If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

**Return type:** `bool`.

**Returns:** `true` if ownership was obtained, otherwise `false`.

**Throws:** Timeout-related exceptions (33.2.4).

The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

**Preconditions:** If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

**Effects:** The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (33.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

**Synchronization:** If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

**Return type:** `bool`.

**Returns:** `true` if ownership was obtained, otherwise `false`.

**Throws:** Timeout-related exceptions (33.2.4).

### 33.6.4.3.2 Class `timed_mutex`

```cpp
namespace std {
    class timed_mutex {
    public:
        timed_mutex();
        ~timed_mutex();

        timed_mutex(const timed_mutex&) = delete;
        timed_mutex& operator=(const timed_mutex&) = delete;

        void lock();  // blocking
        bool try_lock();
        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        using native_handle_type = implementation-defined;  // see 33.2.3
        native_handle_type native_handle();  // see 33.2.3
    }
}
```

The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()` or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has
released ownership with a call to unlock() or the call to try_lock_for() or try_lock_until() times out (having failed to obtain ownership).

2 The class timed_mutex meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if:

(3.1) it destroys a timed_mutex object owned by any thread,

(3.2) a thread that owns a timed_mutex object calls lock(), try_lock(), try_lock_for(), or try_lock_until() on that object, or

(3.3) a thread terminates while owning a timed_mutex object.

33.6.4.3.3 Class recursive_timed_mutex

namespace std {
    class recursive_timed_mutex {
        public:
            recursive_timed_mutex();
            ~recursive_timed_mutex();

            recursive_timed_mutex(const recursive_timed_mutex&) = delete;
            recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

            void lock(); // blocking
            bool try_lock() noexcept;
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();

            using native_handle_type = implementation-defined; // see 33.2.3
            native_handle_type native_handle(); // see 33.2.3
    }
}

The class recursive_timed_mutex provides a recursive mutex with exclusive ownership semantics. If one thread owns a recursive_timed_mutex object, attempts by another thread to acquire ownership of that object will fail (for try_lock()) or block (for lock(), try_lock(), and try_lock_until()) until the owning thread has completely released ownership or the call to try_lock_for() or try_lock_until() times out (having failed to obtain ownership).

2 The class recursive_timed_mutex meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

3 A thread that owns a recursive_timed_mutex object may acquire additional levels of ownership by calling lock(), try_lock(), try_lock_for(), or try_lock_until() on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a recursive_timed_mutex object, additional calls to try_lock(), try_lock_for(), or try_lock_until() fail, and additional calls to lock() throw an exception of type system_error. A thread shall call unlock() once for each level of ownership acquired by calls to lock(), try_lock(), try_lock_for(), and try_lock_until(). Only when all levels of ownership have been released may ownership of the object be acquired by another thread.

4 The behavior of a program is undefined if:

(4.1) it destroys a recursive_timed_mutex object owned by any thread, or

(4.2) a thread terminates while owning a recursive_timed_mutex object.

33.6.4.4 Shared mutex types

33.6.4.4.1 General

The standard library types shared_mutex and shared_timed_mutex are shared mutex types. Shared mutex types meet the requirements of mutex types (33.6.4.2) and additionally meet the requirements set out below. In this description, \( m \) denotes an object of a shared mutex type.
In addition to the exclusive lock ownership mode specified in 33.6.4.2, shared mutex types provide a shared lock ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

The expression `m.lock_shared()` is well-formed and has the following semantics:

**Preconditions**: The calling thread has no ownership of the mutex.

**Effects**: Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.

**Synchronization**: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

**Postconditions**: The calling thread has a shared lock on the mutex.

**Return type**: `void`.

**Throws**: `system_error` when an exception is required (33.2.2).

**Error conditions**:

- `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

The expression `m.unlock_shared()` is well-formed and has the following semantics:

**Preconditions**: The calling thread holds a shared lock on the mutex.

**Effects**: Releases a shared lock on the mutex held by the calling thread.

**Return type**: `void`.

**Synchronization**: This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.

**Throws**: Nothing.

The expression `m.try_lock_shared()` is well-formed and has the following semantics:

**Preconditions**: The calling thread has no ownership of the mutex.

**Effects**: Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

**Synchronization**: If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

**Return type**: `bool`.

**Returns**: `true` if the shared lock was acquired, otherwise `false`.

**Throws**: Nothing.
The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.

The class `shared_mutex` meets all of the shared mutex requirements (33.6.4.4). It is a standard-layout class (11.2).

The behavior of a program is undefined if:

1. it destroys a `shared_mutex` object owned by any thread,
2. a thread attempts to recursively gain any ownership of a `shared_mutex`, or
3. a thread terminates while possessing any ownership of a `shared_mutex`.

`shared_mutex` may be a synonym for `shared_timed_mutex`.

### 33.6.4.5 Shared timed mutex types

The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (33.6.4.3), shared mutex types (33.6.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of an instantiation of `duration` (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).

[Note 1: The shared timed mutex types meet the Cpp17SharedTimedLockable requirements (33.2.5.6). — end note]

The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

1. **Preconditions**: The calling thread has no ownership of the mutex.
2. **Effects**: Attempts to obtain shared lock ownership for the calling thread within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

[Note 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

If an exception is thrown then a shared lock has not been acquired for the current thread.

3. **Synchronization**: If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
4. **Return type**: `bool`.
5. **Returns**: `true` if the shared lock was acquired, otherwise `false`.
6. **Throws**: Timeout-related exceptions (33.2.4).

The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

7. **Preconditions**: The calling thread has no ownership of the mutex.
8. **Effects**: The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (33.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object.

[Note 3: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]
If an exception is thrown then a shared lock has not been acquired for the current thread.

Synchronization: If try_lock_shared_until() returns true, prior unlock() operations on the same object synchronize with (6.9.2) this operation.

Return type: bool.

Returns: true if the shared lock was acquired, otherwise false.

Throws: Timeout-related exceptions (33.2.4).

33.6.4.5.2 Class shared_timed_mutex

```cpp
namespace std {
  class shared_timed_mutex {
    public:
      shared_timed_mutex();
      ~shared_timed_mutex();

      shared_timed_mutex(const shared_timed_mutex&) = delete;
      shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

      // exclusive ownership
      void lock();  // blocking
      bool try_lock();
      template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
      template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
      void unlock();

      // shared ownership
      void lock_shared();  // blocking
      bool try_lock_shared();
      template<class Rep, class Period>
        bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
      template<class Clock, class Duration>
        bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
      void unlock_shared();
  };
}
```

1 The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.

2 The class `shared_timed_mutex` meets all of the shared timed mutex requirements (33.6.4.5). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if:
   - it destroys a `shared_timed_mutex` object owned by any thread,
   - a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
   - a thread terminates while possessing any ownership of a `shared_timed_mutex`.

33.6.5 Locks

33.6.5.1 General

A lock is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to own a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[Note 1: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — end note]

2 Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.
namespace std {
    struct defer_lock_t { }; // do not acquire ownership of the mutex
    struct try_to_lock_t { }; // try to acquire ownership of the mutex
        // without blocking
    struct adopt_lock_t { }; // assume the calling thread has already obtained mutex ownership and manage it

    inline constexpr defer_lock_t defer_lock { };  
    inline constexpr try_to_lock_t try_to_lock { };  
    inline constexpr adopt_lock_t adopt_lock { };  
}

33.6.5.2 Class template lock_guard

namespace std {
    template<class Mutex>
    class lock_guard {
    public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        ~lock_guard();

        lock_guard(const lock_guard&) = delete;
        lock_guard& operator=(const lock_guard&) = delete;

    private:
        mutex_type& pm; // exposition only
    };
}

An object of type lock_guard controls the ownership of a lockable object within a scope. A lock_guard object maintains ownership of a lockable object throughout the lock_guard object's lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by pm does not exist for the entire lifetime of the lock_guard object. The supplied Mutex type shall meet the Cpp17BasicLockable requirements (33.2.5.2).

explicit lock_guard(mutex_type& m);

Effects: Initializes pm with m. Calls m.lock().

lock_guard(mutex_type& m, adopt_lock_t);

Preconditions: The calling thread holds a non-shared lock on m.

Effects: Initializes pm with m.

Throws: Nothing.

~lock_guard();

Effects: Equivalent to: pm.unlock()

33.6.5.3 Class template scoped_lock

namespace std {
    template<class... MutexTypes>
    class scoped_lock {
    public:
        using mutex_type = see below; // Only if sizeof...(MutexTypes) == 1 is true

        explicit scoped_lock(MutexTypes&... m);
        explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
        ~scoped_lock();

        scoped_lock(const scoped_lock&) = delete;
        scoped_lock& operator=(const scoped_lock&) = delete;

    § 33.6.5.3  1881
}
private:
    tuple<MutexTypes&...> pm;  // exposition only
};

An object of type scoped_lock controls the ownership of lockable objects within a scope. A scoped_lock object maintains ownership of lockable objects throughout the scoped_lock object’s lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by pm do not exist for the entire lifetime of the scoped_lock object.

If sizeof...(MutexTypes) is one, let Mutex denote the sole type constituting the pack MutexTypes. Mutex shall meet the Cpp17BasicLockable requirements (33.2.5.2). The member typedef-name mutex_type denotes the same type as Mutex.

Otherwise, all types in the template parameter pack MutexTypes shall meet the Cpp17Lockable requirements (33.2.5.3) and there is no member mutex_type.

explicit scoped_lock(MutexTypes&... m);

Effects: Initializes pm with tie(m...). Then if sizeof...(MutexTypes) is 0, no effects. Otherwise if sizeof...(MutexTypes) is 1, then m.lock(). Otherwise, lock(m...).

explicit scoped_lock(adopt_lock_t, MutexTypes&... m);

Preconditions: The calling thread holds a non-shared lock on each element of m.

Effects: Initializes pm with tie(m...).

Throws: Nothing.

~scoped_lock();

Effects: For all i in [0, sizeof...(MutexTypes)), get<i>(pm).unlock().

33.6.5.4 Class template unique_lock

33.6.5.4.1 General

namespace std {
    template<class Mutex>
    class unique_lock {
        using mutex_type = Mutex;
        // 33.6.5.4.2, construct/copy/destroy
        unique_lock() noexcept;
        explicit unique_lock(mutex_type& m);
        unique_lock(mutex_type& m, defer_lock_t) noexcept;
        unique_lock(mutex_type& m, try_to_lock_t);
        unique_lock(mutex_type& m, adopt_lock_t);
        template<class Clock, class Duration>
        unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
        unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~unique_lock();

        unique_lock(const unique_lock&) = delete;
        unique_lock& operator=(const unique_lock&) = delete;

        unique_lock(unique_lock&& u) noexcept;
        unique_lock& operator=(unique_lock&& u);

        // 33.6.5.4.3, locking
        void lock();
        bool try_lock();

        template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

    } // class unique_lock
};

§ 33.6.5.4.1
An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `unique_lock` object. The supplied `Mutex` type shall meet the `Cpp17BasicLockable` requirements (33.2.5.2).

**Note 1:** `unique_lock<Mutex>` meets the `Cpp17BasicLockable` requirements. If `Mutex` meets the `Cpp17Lockable` requirements (33.2.5.3), `unique_lock<Mutex>` also meets the `Cpp17Lockable` requirements; if `Mutex` meets the `Cpp17TimedLockable` requirements (33.2.5.4), `unique_lock<Mutex>` also meets the `Cpp17TimedLockable` requirements. —end note

### 33.6.5.4.2 Constructors, destructor, and assignment

#### [thread.lock.unique.cons]

**unique_lock()** noexcept;

**Postconditions:** `pm == nullptr` and `owns == false`.

**explicit unique_lock(mutex_type& m);**

**Effects:** Calls `m.lock()`.

**Postconditions:** `pm == addressof(m)` and `owns == true`.

**unique_lock(mutex_type& m, defer_lock_t) noexcept;**

**Postconditions:** `pm == addressof(m)` and `owns == false`.

**unique_lock(mutex_type& m, try_to_lock_t);**

**Preconditions:** The supplied `Mutex` type meets the `Cpp17Lockable` requirements (33.2.5.3).

**Effects:** Calls `m.try_lock()`.

**Postconditions:** `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock()`.

**unique_lock(mutex_type& m, adopt_lock_t);**

**Preconditions:** The calling thread holds a non-shared lock on `m`.

**Postconditions:** `pm == addressof(m)` and `owns == true`.

**Throws:** Nothing.

**template<class Clock, class Duration>**

**unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);**

**Preconditions:** The supplied `Mutex` type meets the `Cpp17TimedLockable` requirements (33.2.5.4).

**Effects:** Calls `m.try_lock_until(abs_time)`.
Postconditions: \( pm == \text{addressof}(m) \) and \( owns == res \), where \( res \) is the value returned by the call to \( m.\text{try_lock_until}(\text{abs\_time}) \).

\[
\text{template<class Rep, class Period>}
\]
\[
\text{unique_lock(mutex\_type& m, const \text{chrono::duration<Rep, Period>>& rel\_time);} 
\]
\[
\text{Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).} 
\]
\[
\text{Effects: Calls } m.\text{try\_lock\_for}(\text{rel\_time}). 
\]
\[
\text{Postconditions: } pm == \text{addressof}(m) \text{ and } owns == res, \text{ where } res \text{ is the value returned by the call to } m.\text{try\_lock\_for}(\text{rel\_time}). 
\]

\[
\text{Postconditions: } pm == \text{addressof}(m) \text{ and } owns == res, \text{ where } res \text{ is the value returned by the call to } m.\text{try\_lock\_until}(\text{abs\_time}). 
\]

\[
\text{unique\_lock(unique\_lock\&\& u) noexcept;} 
\]

\[
\text{Postconditions: } pm == u\_p.pm \text{ and } owns == u\_p.owns \text{ (where } u\_p \text{ is the state of } u \text{ just prior to this construction), } u.pm == 0 \text{ and } u.owns == false. 
\]

\[
\text{unique\_lock\& operator=(unique\_lock\&\& u);} 
\]

\[
\text{Effects: If } owns \text{ calls } pm->unlock(). 
\]

\[
\text{Postconditions: } pm == u\_p.pm \text{ and } owns == u\_p.owns \text{ (where } u\_p \text{ is the state of } u \text{ just prior to this construction), } u.pm == 0 \text{ and } u.owns == false. 
\]

\[\text{[Note 1: With a recursive mutex it is possible for both } *\text{this and } u \text{ to own the same mutex before the assignment. In this case, } *\text{this will own the mutex after the assignment and } u \text{ will not. — end note]}\]

\[
\text{Throws: Nothing.} 
\]

\[
\text{~unique\_lock();} 
\]

\[
\text{Effects: If } owns \text{ calls } pm->unlock(). 
\]

§ 33.6.5.4.3  Locking

\[
\text{void lock();} 
\]

\[
\text{Effects: As if by } pm->lock(). 
\]

\[
\text{Postconditions: } owns == true. 
\]

\[
\text{Throws: Any exception thrown by } pm->lock(). \text{ system\_error when an exception is required (33.2.2).} 
\]

\[
\text{Error conditions:} 
\]

\[
\text{— operation\_not\_permitted — if } pm \text{ is } \text{nullptr.} 
\]

\[
\text{— resource\_deadlock\_would\_occur — if on entry } owns \text{ is true.} 
\]

\[
\text{bool try\_lock();} 
\]

\[
\text{Preconditions: The supplied Mutex meets the Cpp17Lockable requirements (33.2.5.3).} 
\]

\[
\text{Effects: As if by } pm->\text{try\_lock().} 
\]

\[
\text{Postconditions: } owns == res, \text{ where } res \text{ is the value returned by } pm->\text{try\_lock().} 
\]

\[
\text{Returns: The value returned by } pm->\text{try\_lock().} 
\]

\[
\text{Throws: Any exception thrown by } pm->\text{try\_lock(). system\_error when an exception is required (33.2.2).} 
\]

\[
\text{Error conditions:} 
\]

\[
\text{— operation\_not\_permitted — if } pm \text{ is } \text{nullptr.} 
\]

\[
\text{— resource\_deadlock\_would\_occur — if on entry } owns \text{ is true.} 
\]

\[
\text{template<class Clock, class Duration>} 
\]

\[
\text{bool try\_lock\_until(const \text{chrono::time\_point<Clock, Duration>>& abs\_time);} 
\]

\[
\text{Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).} 
\]

\[
\text{Effects: As if by } pm->\text{try\_lock\_until}(\text{abs\_time}). 
\]

\[
\text{Postconditions: } owns == res, \text{ where } res \text{ is the value returned by } pm->\text{try\_lock\_until}(\text{abs\_time}). 
\]

\[
\text{Returns: The value returned by } pm->\text{try\_lock\_until}(\text{abs\_time}). 
\]
Throws: Any exception thrown by \( pm->try\_lock\_until(abstime) \). \texttt{system\_error} when an exception is required (33.2.2).

Error conditions:

- \texttt{operation\_not\_permitted} — if \( pm \) is \texttt{nullptr}.
- \texttt{resource\_deadlock\_would\_occur} — if on entry \texttt{owns} is true.

\[
\begin{align*}
\text{template}\langle\text{class Rep, class Period}\rangle & \\
\text{bool try\_lock\_for(const chrono::duration<Rep, Period>& rel\_time);}
\end{align*}
\]

Preconditions: The supplied Mutex type meets the \textit{Cpp17TimedLockable} requirements (33.2.5.4).

Effects: As if by \( pm->try\_lock\_for(rel\_time) \).

Postconditions: \texttt{owns == res}, where \texttt{res} is the value returned by \( pm->try\_lock\_for(rel\_time) \).

Returns: The value returned by \( pm->try\_lock\_for(rel\_time) \).

Throws: Any exception thrown by \( pm->try\_lock\_for(rel\_time) \). \texttt{system\_error} when an exception is required (33.2.2).

Error conditions:

- \texttt{operation\_not\_permitted} — if \( pm \) is \texttt{nullptr}.
- \texttt{resource\_deadlock\_would\_occur} — if on entry \texttt{owns} is true.

\[
\begin{align*}
\text{void unlock();}
\end{align*}
\]

Effects: As if by \( pm->unlock() \).

Postconditions: \texttt{owns == false}.

Throws: \texttt{system\_error} when an exception is required (33.2.2).

Error conditions:

- \texttt{operation\_not\_permitted} — if on entry \texttt{owns} is false.

33.6.5.4.4 Modifiers

\[
\begin{align*}
\text{void swap(unique\_lock& u) noexcept;}
\end{align*}
\]

Effects: Swaps the data members of \*\texttt{this} and \( u \).

\[
\begin{align*}
\text{mutex\_type* release() noexcept;}
\end{align*}
\]

Postconditions: \texttt{pm == 0} and \texttt{owns == false}.

Returns: The previous value of \( pm \).

\[
\begin{align*}
\text{template<class Mutex>}
\text{void swap(unique\_lock<Mutex>& x, unique\_lock<Mutex>& y) noexcept;}
\end{align*}
\]

Effects: As if by \( x.swap(y) \).

33.6.5.4.5 Observers

\[
\begin{align*}
\text{bool owns\_lock() const noexcept;}
\end{align*}
\]

Returns: \texttt{owns}.

\[
\begin{align*}
\text{explicit operator bool() const noexcept;}
\end{align*}
\]

Returns: \texttt{owns}.

\[
\begin{align*}
\text{mutex\_type *mutex() const noexcept;}
\end{align*}
\]

Returns: \texttt{pm}.

33.6.5.5 Class template \texttt{shared\_lock}

33.6.5.5.1 General

\[
\begin{align*}
\text{namespace std {}
\text{template<class Mutex>}
\text{class shared\_lock {}
\end{align*}
\]
public:
  using mutex_type = Mutex;

  // 33.6.5.5.2, construct/copy/destroy
  shared_lock() noexcept; // 33.6.5.5.2
  explicit shared_lock(mutex_type& m); // blocking
  shared_lock(mutex_type& m, defer_lock_t) noexcept;
  shared_lock(mutex_type& m, try_to_lock_t);
  shared_lock(mutex_type& m, adopt_lock_t);
  template<class Clock, class Duration>
    shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
  template<class Rep, class Period>
    shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
  ~shared_lock();

  shared_lock(const shared_lock&) = delete;
  shared_lock& operator=(const shared_lock&) = delete;

  shared_lock(shared_lock&& u) noexcept;
  shared_lock& operator=(shared_lock&& u) noexcept;

  // 33.6.5.5.3, locking
  void lock(); // blocking
  bool try_lock();
  template<class Rep, class Period>
    bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
  template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
  void unlock();

  // 33.6.5.5.4, modifiers
  void swap(shared_lock& u) noexcept;
  mutex_type* release() noexcept;

  // 33.6.5.5.5, observers
  bool owns_lock() const noexcept;
  explicit operator bool () const noexcept;
  mutex_type* mutex() const noexcept;

private:
  mutex_type* pm; // exposition only
  bool owns; // exposition only
};

1 An object of type shared_lock controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another shared_lock object. Objects of type shared_lock are not copyable but are movable. The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed to by pm does not exist for the entire remaining lifetime (6.7.3) of the shared_lock object. The supplied Mutex type shall meet the Cpp17SharedLockable requirements (33.2.5.5).

2 [Note 1: shared_lock<Mutex> meets the Cpp17Lockable requirements (33.2.5.3). If Mutex meets the Cpp17Shared-TimedLockable requirements (33.2.5.6), shared_lock<Mutex> also meets the Cpp17TimedLockable requirements (33.2.5.4). — end note]

33.6.5.5.2 Constructors, destructor, and assignment [thread.lock.shared.cons]

shared_lock() noexcept;

1 Postconditions: pm == nullptr and owns == false.

explicit shared_lock(mutex_type& m);

2 Effects: Calls m.lock_shared().

3 Postconditions: pm == addressof(m) and owns == true.
shared_lock(mutex_type& m, defer_lock_t) noexcept;

Postconditions: pm == addressof(m) and owns == false.

shared_lock(mutex_type& m, try_to_lock_t);

Effects: Calls m.try_lock_shared().

Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to m.try_lock_shared().

shared_lock(mutex_type& m, adopt_lock_t);

Preconditions: The calling thread holds a shared lock on m.

Postconditions: pm == addressof(m) and owns == true.

template<class Clock, class Duration>
shared_lock(mutex_type& m,
            const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: Calls m.try_lock_shared_until(abs_time).

Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to m.try_lock_shared_until(abs_time).

template<class Rep, class Period>
shared_lock(mutex_type& m,
            const chrono::duration<Rep, Period>& rel_time);

Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: Calls m.try_lock_shared_for(rel_time).

Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to m.try_lock_shared_for(rel_time).

shared_lock shared_lock(shared_lock& sl) noexcept;

Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to this construction), sl.pm == nullptr and sl.owns == false.

shared_lock& operator=(shared_lock& sl) noexcept;

Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to this assignment), sl.pm == nullptr and sl.owns == false.

33.6.5.5.3 Locking

void lock();

Effects: As if by pm->lock_shared().

Postconditions: owns == true.

Throws: Any exception thrown by pm->lock_shared(). system_error when an exception is required (33.2.2).

Error conditions:

(4.1) operation_not_permitted — if pm is nullptr.

(4.2) resource_deadlock_would_occur — if on entry owns is true.

bool try_lock();

Effects: As if by pm->try_lock_shared().

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared().
Returns: The value returned by the call to `pm->try_lock_shared()`.

Throws: Any exception thrown by `pm->try_lock_shared()`. `system_error` when an exception is required (33.2.2).

Error conditions:
- `operation_not_permitted` — if `pm` is `nullptr`.
- `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```cpp
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

Preconditions: Mutex meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).

Effects: As if by `pm->try_lock_shared_until(abs_time)`.

Postconditions: `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_until(abs_time)`.

Returns: The value returned by the call to `pm->try_lock_shared_until(abs_time)`.

Throws: Any exception thrown by `pm->try_lock_shared_until(abs_time)`. `system_error` when an exception is required (33.2.2).

Error conditions:
- `operation_not_permitted` — if `pm` is `nullptr`.
- `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```cpp
template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

Preconditions: Mutex meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).

Effects: As if by `pm->try_lock_shared_for(rel_time)`.

Postconditions: `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.

Returns: The value returned by the call to `pm->try_lock_shared_for(rel_time)`.

Throws: Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` when an exception is required (33.2.2).

Error conditions:
- `operation_not_permitted` — if `pm` is `nullptr`.
- `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```cpp
void unlock();
```

Effects: As if by `pm->unlock_shared()`.

Postconditions: `owns == false`.

Throws: `system_error` when an exception is required (33.2.2).

Error conditions:
- `operation_not_permitted` — if on entry `owns` is `false`.

### 33.6.5.5.4 Modifiers

```cpp
void swap(shared_lock& sl) noexcept;
```

Effects: Swaps the data members of `*this` and `sl`.

```cpp
mutex_type* release() noexcept;
```

Postconditions: `pm == nullptr` and `owns == false`.

Returns: The previous value of `pm`.

§ 33.6.5.5.4
template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;

Effects: As if by x.swap(y).

33.6.5.5 Observers

bool owns_lock() const noexcept;

Returns: owns.

explicit operator bool() const noexcept;

Returns: owns.

mutex_type* mutex() const noexcept;

Returns: pm.

33.6.6 Generic locking algorithms

template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);

Preconditions: Each template parameter type meets the Cpp17Lockable requirements.

[Note 1: The unique_lock class template meets these requirements when suitably instantiated. — end note]

Effects: Calls try_lock() for each argument in order beginning with the first until all arguments have been processed or a call to try_lock() fails, either by returning false or by throwing an exception. If a call to try_lock() fails, unlock() is called for all prior arguments with no further calls to try_lock().

Returns: -1 if all calls to try_lock() returned true, otherwise a zero-based index value that indicates the argument for which try_lock() returned false.

template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

Preconditions: Each template parameter type meets the Cpp17Lockable requirements.

[Note 2: The unique_lock class template meets these requirements when suitably instantiated. — end note]

Effects: All arguments are locked via a sequence of calls to lock(), try_lock(), or unlock() on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

[Note 3: A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — end note]

If a call to lock() or try_lock() throws an exception, unlock() is called for any argument that had been locked by a call to lock() or try_lock().

33.6.7 Call once

33.6.7.1 Struct once_flag

namespace std {
struct once_flag {
  constexpr once_flag() noexcept;
  once_flag(const once_flag&) = delete;
  once_flag& operator=(const once_flag&) = delete;
};
}

The class once_flag is an opaque data structure that call_once uses to initialize data without causing a data race or deadlock.

constexpr once_flag() noexcept;

Synchronization: The construction of a once_flag object is not synchronized.

Postconditions: The object’s internal state is set to indicate to an invocation of call_once with the object as its initial argument that no function has been called.
33.6.7.2 Function call_once

template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);

Mandates: is_invocable_v<Callable, Args...> is true.

Effects: An execution of call_once that does not call its func is a passive execution. An execution of call_once that calls its func is an active execution. An active execution calls INVOKE(std::forward<Callable>(func), std::forward<Args>(args)...)(22.10.4). If such a call to func throws an exception the execution is exceptional, otherwise it is returning. An exceptional execution propagates the exception to the caller of call_once. Among all executions of call_once for any given once_flag: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

[Note 1: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — end note]

Synchronization: For any given once_flag: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

Throws: system_error when an exception is required (33.2.2), or any exception thrown by func.

[Example 1:
  // global flag, regular function
  void init();
  std::once_flag flag;

  void f() {
    std::call_once(flag, init);
  }

  // function static flag, function object
  struct initializer {
    void operator()() {
    }
  };

  void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
  }

  // object flag, member function
  class information {
    std::once_flag verified;
    void verifier();
  public:
    void verify() { std::call_once(verified, &information::verifier, *this); }
  };
  — end example]

33.7 Condition variables

33.7.1 General

Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class condition_variable provides a condition variable that can only wait on an object of type unique_lock<mutex>, allowing the implementation to be more efficient. Class condition_variable_any provides a general condition variable that can wait on objects of user-supplied lock types.

Condition variables permit concurrent invocation of the wait, wait_for, wait_until, notify_one and notify_all member functions.

The executions of notify_one and notify_all are atomic. The executions of wait, wait_for, and wait_until are performed in three atomic parts:
1. the release of the mutex and entry into the waiting state;
2. the unblocking of the wait; and
3. the reacquisition of the lock.

The implementation behaves as if all executions of notify_one, notify_all, and each part of the wait, wait_for, and wait_until executions are executed in a single unspecified total order consistent with the “happens before” order.

Condition variable construction and destruction need not be synchronized.

33.7.2 Header <condition_variable> synopsis

namespace std {
  // 33.7.4, class condition_variable
  class condition_variable;
  // 33.7.5, class condition_variable_any
  class condition_variable_any;

  // 33.7.3, non-member functions
  void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

  enum class cv_status { no_timeout, timeout };
}

33.7.3 Non-member functions

void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

1 Preconditions: lk is locked by the calling thread and either
   — no other thread is waiting on cond, or
   — lk.mutex() returns the same value for each of the lock arguments supplied by all concurrently
     waiting (via wait, wait_for, or wait_until) threads.

2 Effects: Transfers ownership of the lock associated with lk into internal storage and schedules cond to
   be notified when the current thread exits, after all objects of thread storage duration associated with
   the current thread have been destroyed. This notification is equivalent to:
   lk.unlock();
   cond.notify_all();

3 Synchronization: The implied lk.unlock() call is sequenced after the destruction of all objects with
   thread storage duration associated with the current thread.

4 [Note 1: The supplied lock is held until the thread exits, which might cause deadlock due to lock ordering
   issues. —end note]

5 [Note 2: It is the user’s responsibility to ensure that waiting threads do not erroneously assume that the thread
   has finished if they experience spurious wakeups. This typically requires that the condition being waited for
   is satisfied while holding the lock on lk, and that this lock is not released and reacquired prior to calling
   notify_all_at_thread_exit. —end note]

33.7.4 Class condition_variable

namespace std {
  class condition_variable {
    public:
      condition_variable();
      ~condition_variable();

      condition_variable(const condition_variable&) = delete;
      condition_variable& operator=(const condition_variable&) = delete;

      void notify_one() noexcept;
      void notify_all() noexcept;
      void wait(unique_lock<mutex>& lock);
      template<class Predicate>
        void wait(unique_lock<mutex>& lock, Predicate pred);
  }
template<class Clock, class Duration>
    cv_status wait_until(unique_lock<mutex>& lock,
                const chrono::time_point<Clock, Duration>& abs_time);
template<class Clock, class Duration, class Predicate>
    bool wait_until(unique_lock<mutex>& lock,
               const chrono::time_point<Clock, Duration>& abs_time,
               Predicate pred);
template<class Rep, class Period>
    cv_status wait_for(unique_lock<mutex>& lock,
                    const chrono::duration<Rep, Period>& rel_time);
template<class Rep, class Period, class Predicate>
    bool wait_for(unique_lock<mutex>& lock,
                  const chrono::duration<Rep, Period>& rel_time,
                  Predicate pred);

    using native_handle_type = implementation-defined;  // see 33.2.3
    native_handle_type native_handle();  // see 33.2.3
};

1 The class condition_variable is a standard-layout class (11.2).

    condition_variable();
2    Throws: system_error when an exception is required (33.2.2).
3    Error conditions:
(3.1) — resource_unavailable_try_again — if some non-memory resource limitation prevents initialization.

~condition_variable();
4    Preconditions: There is no thread blocked on *this.
[Note 1: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on *this once the destructor has begun, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. — end note]

    void notify_one() noexcept;
5    Effects: If any threads are blocked waiting for *this, unblocks one of those threads.

    void notify_all() noexcept;
6    Effects: Unblocks all threads that are blocked waiting for *this.

    void wait(unique_lock<mutex>& lock);
7    Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(7.1) — no other thread is waiting on this condition_variable object or
(7.2) — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.
8    Effects:
(8.1) — Atomically calls lock.unlock() and blocks on *this.
(8.2) — When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.
(8.3) — The function will unblock when signaled by a call to notify_one() or a call to notify_all(), or
spuriously.
9    Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.
10    Throws: Nothing.

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]
template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(12.1) no other thread is waiting on this condition_variable object or
(12.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects: Equivalent to:
while (!pred())
    wait(lock);

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Throws: Any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
    const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(17.1) no other thread is waiting on this condition_variable object or
(17.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects:
(18.1) Atomically calls lock.unlock() and blocks on *this.
(18.2) When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.
(18.3) The function will unblock when signaled by a call to notify_one(), a call to notify_all(),
expiration of the absolute timeout (33.2.4) specified by abs_time, or spuriously.
(18.4) If the function exits via an exception, lock.lock() is called prior to exiting the function.

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Returns: cv_status::timeout if the absolute timeout (33.2.4) specified by abs_time expired, otherwise
cv_status::no_timeout.

Throws: Timeout-related exceptions (33.2.4).

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 4: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
    const chrono::duration<Rep, Period>& rel_time);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(23.1) no other thread is waiting on this condition_variable object or
(23.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects: Equivalent to:
return wait_until(lock, chrono::steady_clock::now() + rel_time);

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Returns: cv_status::timeout if the relative timeout (33.2.4) specified by rel_time expired, otherwise
cv_status::no_timeout.

Throws: Timeout-related exceptions (33.2.4).

Remarks: If the function fails to meet the postcondition, terminate is invoked (14.6.2).
[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]
template<class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
    const chrono::time_point<Clock, Duration>& abs_time,
    Predicate pred);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(29.1) no other thread is waiting on this condition_variable object or
(29.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects: Equivalent to:
while (!pred())
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
return true;

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

[Note 6: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout
was triggered. — end note]

Throws: Timeout-related exceptions (33.2.4) or any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 7: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
    const chrono::duration<Rep, Period>& rel_time,
    Predicate pred);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(35.1) no other thread is waiting on this condition_variable object or
(35.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects: Equivalent to:
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));

[Note 8: There is no blocking if pred() is initially true, even if the timeout has already expired. — end note]

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

[Note 9: The returned value indicates whether the predicate evaluates to true regardless of whether the timeout
was triggered. — end note]

Throws: Timeout-related exceptions (33.2.4) or any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 10: This can happen if the re-locking of the mutex throws an exception. — end note]

33.7.5 Class condition_variable_any

33.7.5.1 General

In this subclause 33.7.5, template arguments for template parameters named Lock shall meet the Cpp17Basic-
Lockable requirements (33.2.5.2).

[Note 1: All of the standard mutex types meet this requirement. If a type other than one of the standard mutex
types or a unique_lock wrapper for a standard mutex type is used with condition_variable_any, any necessary
synchronization is assumed to be in place with respect to the predicate associated with the condition_variable_any
instance. — end note]

namespace std {
    class condition_variable_any {
    public:
        condition_variable_any();
        ~condition_variable_any();
    }
void notify_one() noexcept;
void notify_all() noexcept;

// 33.7.5.2. noninterruptible waits
template<class Lock>
void wait(Lock& lock);
template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);

template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
template<class Lock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
               Predicate pred);

template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

// 33.7.5.3. interruptible waits
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
               const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
             const chrono::duration<Rep, Period>& rel_time, Predicate pred);

condition_variable_any();

2 **Throws**: `bad_alloc` or `system_error` when an exception is required (33.2.2).

3 **Error conditions**:

(3.1) —`resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

(3.2) —`operation_not_permitted` — if the thread does not have the privilege to perform the operation.

~condition_variable_any();

4 **Preconditions**: There is no thread blocked on `*this`.

[Note 2: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. —end note]

void notify_one() noexcept;

5 **Effects**: If any threads are blocked waiting for `*this`, unblocks one of those threads.

void notify_all() noexcept;

6 **Effects**: Unblocks all threads that are blocked waiting for `*this`.

33.7.5.2 Noninterruptible waits

template<class Lock>
void wait(Lock& lock);

1 **Effects**: 

§ 33.7.5.2
— Atomically calls `lock.unlock()` and blocks on `*this`.
— When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
— The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

**Postconditions:** The lock is locked by the calling thread.

**Throws:** Nothing.

**Remarks:** If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 1: This can happen if the re-locking of the mutex throws an exception. — end note]

```cpp
template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
while (!pred())
    wait(lock);
```

```cpp
template<class Lock, class Clock, class Duration>
int wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
```

**Effects:**

— Atomically calls `lock.unlock()` and blocks on `*this`.
— When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
— The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (33.2.4) specified by `abs_time`, or spuriously.
— If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

**Postconditions:** The lock is locked by the calling thread.

**Returns:** `cv_status::timeout` if the absolute timeout (33.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

**Throws:** Timeout-related exceptions (33.2.4).

**Remarks:** If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

```cpp
template<class Lock, class Rep, class Period>
int wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

**Effects:** Equivalent to:

```cpp
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

**Postconditions:** The lock is locked by the calling thread.

**Returns:** `cv_status::timeout` if the relative timeout (33.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

**Throws:** Timeout-related exceptions (33.2.4).

**Remarks:** If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]

```cpp
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
while (!pred())
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
    return true;
```

[Note 4: There is no blocking if `pred()` is initially `true`, or if the timeout has already expired. — end note]

[Note 5: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — end note]
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

Effects: Equivalent to:

return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));

33.7.5.3 Interruptible waits

The following wait functions will be notified when there is a stop request on the passed stop_token. In that case the functions return immediately, returning false if the predicate evaluates to false.

template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);

Effects: Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

while (!stoken.stop_requested()) {
    if (pred())
        return true;
    wait(lock);
}
return pred();

[Note 1: The returned value indicates whether the predicate evaluated to true regardless of whether there was a stop request. — end note]

Postconditions: lock is locked by the calling thread.

Throws: Any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate is called (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
    const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

Effects: Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

while (!stoken.stop_requested()) {
    if (pred())
        return true;
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
}
return pred();

[Note 3: There is no blocking if pred() is initially true, stoken.stop_requested() was already true or the timeout has already expired. — end note]

[Note 4: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout was triggered or a stop request was made. — end note]

Postconditions: lock is locked by the calling thread.

Throws: Timeout-related exceptions (33.2.4), or any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate is called (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]
Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

### 33.8.2 Header `<semaphore>` synopsis

```cpp
namespace std {
  // 33.8.3, class template counting_semaphore
  template<ptrdiff_t least_max_value = implementation-defined>
  class counting_semaphore;

  using binary_semaphore = counting_semaphore<1>;
}
```

### 33.8.3 Class template counting_semaphore

```cpp
namespace std {
  template<ptrdiff_t least_max_value = implementation-defined>
  class counting_semaphore {
    public:
      static constexpr ptrdiff_t max() noexcept;
      constexpr explicit counting_semaphore(ptrdiff_t desired);
      ~counting_semaphore();
      counting_semaphore(const counting_semaphore&) = delete;
      counting_semaphore& operator=(const counting_semaphore&) = delete;
      void release(ptrdiff_t update = 1);
      void acquire();
      bool try_acquire() noexcept;
      template<class Rep, class Period>
      bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
      template<class Clock, class Duration>
      bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

    private:
      ptrdiff_t counter; // exposition only
  };
```
void release(ptrdiff_t update = 1);

Preconditions: update >= 0 is true, and update <= max() - counter is true.

Effects: Atomically execute counter += update. Then, unblocks any threads that are waiting for counter to be greater than zero.

Synchronization: Strongly happens before invocations of try_acquire that observe the result of the effects.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

bool try_acquire() noexcept;

Effects: Attempts to atomically decrement counter if it is positive, without blocking. If counter is not decremented, there is no effect and try_acquire immediately returns. An implementation may fail to decrement counter even if it is positive.

[Note 1: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (33.5). — end note]

An implementation should ensure that try_acquire does not consistently return false in the absence of contending semaphore operations.

Returns: true if counter was decremented, otherwise false.

void acquire();

Effects: Repeatedly performs the following steps, in order:

— Evaluates try_acquire(). If the result is true, returns.
— Blocks on *this until counter is greater than zero.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

template<class Rep, class Period>
bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);

template<class Clock, class Duration>
bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

Effects: Repeatedly performs the following steps, in order:

— Evaluates try_acquire(). If the result is true, returns true.
— Blocks on *this until counter is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns false.

The timeout expires (33.2.4) when the current time is after abs_time (for try_acquire_until) or when at least rel_time has passed from the start of the function (for try_acquire_for).

Throws: Timeout-related exceptions (33.2.4), or system_error when a non-timeout-related exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

33.9 Coordination types

33.9.1 General

Subclause 33.9 describes various concepts related to thread coordination, and defines the coordination types latch and barrier. These types facilitate concurrent computation performed by a number of threads.

33.9.2 Latches

33.9.2.1 General

A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the count_down function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.
33.9.2.2 Header <latch> synopsis

namespace std {
    class latch;
}

33.9.2.3 Class latch

namespace std {
    class latch {
        public:
            static constexpr ptrdiff_t max() noexcept;
            constexpr explicit latch(ptrdiff_t expected);
            ~latch();
            latch(const latch&) = delete;
            latch& operator=(const latch&) = delete;
            void count_down(ptrdiff_t update = 1);
            bool try_wait() const noexcept;
            void wait() const;
            void arrive_and_wait(ptrdiff_t update = 1);
    private:
        ptrdiff_t counter;  // exposition only
    };
}

A latch maintains an internal counter that is initialized when the latch is created. Threads can block on the latch object, waiting for counter to be decremented to zero.

Concurrent invocations of the member functions of latch, other than its destructor, do not introduce data races.

static constexpr ptrdiff_t max() noexcept;

Returns: The maximum value of counter that the implementation supports.

constexpr explicit latch(ptrdiff_t expected);

Preconditions: expected >= 0 is true and expected <= max() is true.

Effects: Initializes counter with expected.

Throws: Nothing.

void count_down(ptrdiff_t update = 1);

Preconditions: update >= 0 is true, and update <= counter is true.

Effects: Atomically decrements counter by update. If counter is equal to zero, unblocks all threads blocked on this.

Synchronization: Strongly happens before the returns from all calls that are unblocked.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

bool try_wait() const noexcept;

Returns: With very low probability false. Otherwise counter == 0.

void wait() const;

Effects: If counter equals zero, returns immediately. Otherwise, blocks on this until a call to count_down that decrements counter to zero.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).
void arrive_and_wait(ptrdiff_t update = 1);

Effects: Equivalent to:
  count_down(update);
  wait();

33.9.3 Barriers

33.9.3.1 General

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

[Note 1: A barrier is useful for managing repeated tasks that are handled by multiple threads. — end note]

33.9.3.2 Header <barrier> synopsis

namespace std {
  template<class CompletionFunction = see below>
  class barrier;
}

33.9.3.3 Class template barrier

namespace std {
  template<class CompletionFunction = see below>
  class barrier {
    public:
      using arrival_token = see below;

      static constexpr ptrdiff_t max() noexcept;
      constexpr explicit barrier(ptrdiff_t expected,
                                  CompletionFunction f = CompletionFunction());
      ~barrier();
      barrier(const barrier&) = delete;
      barrier& operator=(const barrier&) = delete;

      [[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
      void wait(arrival_token&& arrival) const;
      void arrive_and_wait();
      void arrive_and_drop();

    private:
      CompletionFunction completion; // exposition only
    };
  }

1 Each barrier phase consists of the following steps:

(1.1) — The expected count is decremented by each call to arrive or arrive_and_drop.

(1.2) — Exactly once after the expected count reaches zero, a thread executes the completion step during its call to arrive, arrive_and_drop, or wait, except that it is implementation-defined whether the step executes if no thread calls wait.

(1.3) — When the completion step finishes, the expected count is reset to what was specified by the expected argument to the constructor, possibly adjusted by calls to arrive_and_drop, and the next phase starts.

2 Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling wait, and will remain blocked until the phase completion step is run.

3 The phase completion step that is executed at the end of each phase has the following effects:

(3.1) — Invokes the completion function, equivalent to completion().

(3.2) — Unblocks all threads that are blocked on the phase synchronization point.
The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the \texttt{CompletionFunction} template parameter, the behavior is undefined if any of the barrier object’s member functions other than \texttt{wait} are called while the completion step is in progress.

Concurrent invocations of the member functions of \texttt{barrier}, other than its destructor, do not introduce data races. The member functions \texttt{arrive} and \texttt{arrive\_and\_drop} execute atomically.

\texttt{CompletionFunction} shall meet the \texttt{Cpp17MoveConstructible} (Table 31) and \texttt{Cpp17Destructible} (Table 35) requirements. \texttt{is\_nothrow\_invocable\_v<CompletionFunction&>} shall be true.

The default value of the \texttt{CompletionFunction} template parameter is an unspecified type, such that, in addition to satisfying the requirements of \texttt{CompletionFunction}, it meets the \texttt{Cpp17DefaultConstructible} requirements (Table 30) and \texttt{completion()} has no effects.

\texttt{barrier::arrival\_token} is an unspecified type, such that it meets the \texttt{Cpp17MoveConstructible} (Table 31), \texttt{Cpp17MoveAssignable} (Table 33), and \texttt{Cpp17Destructible} (Table 35) requirements.

\begin{verbatim}
static constexpr decltype(max()) max() noexcept;
\end{verbatim}

\texttt{Returns}: The maximum expected count that the implementation supports.

\begin{verbatim}
constexpr explicit barrier(ptrdiff_t expected, CompletionFunction f = CompletionFunction());
\end{verbatim}

\texttt{Preconditions}: expected \( \geq 0 \) is true and expected \( \leq \text{max()} \) is true.

\texttt{Effects}: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to expected. Initializes completion with std::move(f). Starts the first phase.

[\textit{Note 1}: If expected is 0 this object can only be destroyed. — end note]

\texttt{Throws}: Any exception thrown by \texttt{CompletionFunction}'s move constructor.

\begin{verbatim}
[[nodiscard]] arrival\_token arrive(ptrdiff_t update = 1);
\end{verbatim}

\texttt{Preconditions}: update > 0 is true, and update is less than or equal to the expected count for the current barrier phase.

\texttt{Effects}: Constructs an object of type \texttt{arrival\_token} that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by update.

\texttt{Synchronization}: The call to \texttt{arrive} strongly happens before the start of the phase completion step for the current phase.

\texttt{Returns}: The constructed \texttt{arrival\_token} object.

\texttt{Throws}: \texttt{system\_error} when an exception is required (33.2.2).

\texttt{Error conditions}: Any of the error conditions allowed for mutex types (33.6.4.2).

[\textit{Note 2}: This call can cause the completion step for the current phase to start. — end note]

\begin{verbatim}
void wait(arrival\_token&& arrival) const;
\end{verbatim}

\texttt{Preconditions}: arrival is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

\texttt{Effects}: Blocks at the synchronization point associated with std::move(arrival) until the phase completion step of the synchronization point’s phase is run.

[\textit{Note 3}: If \texttt{arrival} is associated with the synchronization point for a previous phase, the call returns immediately. — end note]

\texttt{Throws}: \texttt{system\_error} when an exception is required (33.2.2).

\texttt{Error conditions}: Any of the error conditions allowed for mutex types (33.6.4.2).

\begin{verbatim}
void arrive\_and\_wait();
\end{verbatim}

\texttt{Effects}: Equivalent to: \texttt{wait(arrive())}.

\begin{verbatim}
void arrive\_and\_drop();
\end{verbatim}

\texttt{Preconditions}: The expected count for the current barrier phase is greater than zero.
Effects: Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

Synchronization: The call to `arrive_and_drop` strongly happens before the start of the phase completion step for the current phase.

Throws: `system_error` when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

[Note 4: This call can cause the completion step for the current phase to start. — end note]

33.10 Futures

33.10.1 Overview

33.10 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

[Note 1: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]

33.10.2 Header `<future>` synopsis

```cpp
namespace std {
enum class future_errc {
   broken_promise = implementation-defined,
   future_already_retrieved = implementation-defined,
   promise_already_satisfied = implementation-defined,
   no_state = implementation-defined
};

enum class launch : unspecified {
   async = unspecified,
   deferred = unspecified,
   implementation-defined
};

enum class future_status {
   ready,
   timeout,
   deferred
};

// 33.10.3, error handling
template<> struct is_error_code_enum<future_errc> : public true_type { };
error_code make_error_code(future_errc e) noexcept;
error_condition make_error_condition(future_errc e) noexcept;

const error_category& future_category() noexcept;

// 33.10.4, class future_error
class future_error;

// 33.10.6, class template promise
template<class R> class promise;
template<class R> class promise<R&>;
template<> class promise<void>;

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

// 33.10.7, class template future
template<class R> class future;
template<class R> class future<R>;
}
```
template<> class future<void>;

// 33.10.8, class template shared_future
template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

// 33.10.10, class template packaged_task
template<class> class packaged_task; // not defined
template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)>

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

// 33.10.9, function template async
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);

template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);

1 The enum type `launch` is a bitmask type (16.3.3.3.3) with elements `launch::async` and `launch::deferred`. [Note 1: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if” rule. — end note]  
2 The enum values of `future_errc` are distinct and not zero.

33.10.3 Error handling [futures.errors]

const error_category& future_category() noexcept;

1 Returns: A reference to an object of a type derived from class `error_category`.  
2 The object’s `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object’s `name` virtual function returns a pointer to the string "future".

error_code make_error_code(future_errc e) noexcept;

3 Returns: `error_code(static_cast<int>(e), future_category())`.

error_condition make_error_condition(future_errc e) noexcept;

4 Returns: `error_condition(static_cast<int>(e), future_category())`.

33.10.4 Class future_error [futures.future.error]

namespace std {

class future_error : public logic_error {

public:

explicit future_error(future_errc e);

const error_code& code() const noexcept;
const char* what() const noexcept;

private:

error_code ec_; // exposition only

};
}

explicit future_error(future_errc e);

1 Effects: Initializes `ec_` with `make_error_code(e)`.

§ 33.10.4
const error_code& code() const noexcept;

Returns: ec_

const char* what() const noexcept;

Returns: An NTBS incorporating code().message().

### 33.10.5 Shared state

Many of the classes introduced in subclause 33.10 use some state to communicate results. This shared state consists of some state information and some (possibly not yet evaluated) result, which can be a (possibly void) value or an exception.

[Note 1: Futures, promises, and tasks defined in this Clause reference such shared state. — end note]

An asynchronous return object is an object that reads results from a shared state. A waiting function of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (33.2.5), then it is a timed waiting function, otherwise it is a non-timed waiting function.

An asynchronous provider is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[Note 3: Such as promises or tasks. — end note]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

1. If the return object or provider holds the last reference to its shared state, the shared state is destroyed; and
2. the return object or provider gives up its reference to its shared state; and
3. these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to std::async, the shared state is not yet ready, and this was the last reference to the shared state.

When an asynchronous provider is said to make its shared state ready, it means:

1. first, the provider marks its shared state as ready; and
2. second, the provider unblocks any execution agents waiting for its shared state to become ready.

When an asynchronous provider is said to abandon its shared state, it means:

1. first, if that state is not ready, the provider
   1.1 stores an exception object of type future_error with an error condition of broken_promise within its shared state; and then
   1.2 makes its shared state ready;
   1.3 second, the provider releases its shared state.

A shared state is ready only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.

Some functions (e.g., promise::set_value_at_thread_exit) delay making the shared state ready until the calling thread exits. The destruction of each of that thread’s objects with thread storage duration (6.7.5.3) is sequenced before making that shared state ready.

Access to the result of the same shared state may conflict (6.9.2).
[Note 4: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (33.10.8) must either use read-only operations or provide additional synchronization. — end note]

### 33.10.6 Class template promise

```cpp
namespace std {
    template<class R>
    class promise {
    public:
        promise();
        template<class Allocator>
        promise(allocator_arg_t, const Allocator& a);
        promise(promise&& rhs) noexcept;
        promise(const promise&) = delete;
        ~promise();

        // assignment
        promise& operator=(promise&& rhs) noexcept;
        void swap(promise& other) noexcept;

        // retrieving the result
        future<R> get_future();

        // setting the result
        void set_value(see below);
        void set_exception(exception_ptr p);

        // setting the result with deferred notification
        void set_value_at_thread_exit(see below);
        void set_exception_at_thread_exit(exception_ptr p);
    }

    template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc>;
}
```

1. For the primary template, `R` shall be an object type that meets the `Cpp17Destructible` requirements.
2. The implementation provides the template `promise` and two specializations, `promise<R&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.
3. The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```cpp
    template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc> : true_type {};
```

4. **Preconditions:** `Alloc` meets the `Cpp17Allocator` requirements (16.4.4.6.1).

```cpp
    promise();
    template<class Allocator>
    promise(allocator_arg_t, const Allocator& a);
```

5. **Effects:** Creates a shared state. The second constructor uses the allocator `a` to allocate memory for the shared state.

```cpp
    promise(promise&& rhs) noexcept;
```

6. **Effects:** Transfers ownership of the shared state of `rhs` (if any) to the newly-constructed object.

```cpp
    promise(const promise&) = delete;
```

7. **Postconditions:** `rhs` has no shared state.
~promise();

Effects: Abandons any shared state (33.10.5).

promise& operator=(promise& rhs) noexcept;

Effects: Abandons any shared state (33.10.5) and then as if promise(std::move(rhs)).swap(*this).

Returns: *this.

void swap(promise& other) noexcept;

Effects: Exchanges the shared state of *this and other.

Postconditions: *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

future<R> get_future();

Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to set_value, set_exception, set_value_at_thread_exit, or set_exception_at_thread_exit.

[Note 1: Such calls need not synchronize with each other. — end note]

Returns: A future<R> object with the same shared state as *this.

Throws: future_error if *this has no shared state or if get_future has already been called on a promise with the same shared state as *this.

Error conditions:
(16.1) — future_already_retrieved if get_future has already been called on a promise with the same shared state as *this.
(16.2) — no_state if *this has no shared state.

void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();

Effects: Atomically stores the value r in the shared state and makes that state ready (33.10.5).

Throws:
(18.1) — future_error if its shared state already has a stored value or exception, or
(18.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or
(18.3) — for the second version, any exception thrown by the constructor selected to move an object of R.

Error conditions:
(19.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(19.2) — no_state if *this has no shared state.

void set_exception(exception_ptr p);

Preconditions: p is not null.

Effects: Atomically stores the exception pointer p in the shared state and makes that state ready (33.10.5).

Throws: future_error if its shared state already has a stored value or exception.

Error conditions:
(23.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(23.2) — no_state if *this has no shared state.
void promise<void>::set_value_at_thread_exit();

24 Effects: Stores the value r in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

25 Throws:

25.1 future_error if its shared state already has a stored value or exception, or

25.2 for the first version, any exception thrown by the constructor selected to copy an object of R, or

25.3 for the second version, any exception thrown by the constructor selected to move an object of R.

26 Error conditions:

26.1 promise_already_satisfied if its shared state already has a stored value or exception.

26.2 no_state if *this has no shared state.

void set_exception_at_thread_exit(exception_ptr p);

27 Preconditions: p is not null.

28 Effects: Stores the exception pointer p in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

29 Throws: future_error if an error condition occurs.

30 Error conditions:

30.1 promise_already_satisfied if its shared state already has a stored value or exception.

30.2 no_state if *this has no shared state.

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

31 Effects: As if by x.swap(y).

33.10.7 Class template future

1 The class template future defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed future object has no shared state. A future object with shared state can be created by functions on asynchronous providers (33.10.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a future object can be set by calling a respective function on an object that shares the same shared state.

2 [Note 1: Member functions of future do not synchronize with themselves or with member functions of shared_future. —end note]

3 The effect of calling any member function other than the destructor, the move-assignment operator, share, or valid on a future object for which valid() == false is undefined.

[Note 2: It is valid to move from a future object for which valid() == false. —end note]

Recommended practice: Implementations should detect this case and throw an object of type future_error with an error condition of future_errc::no_state.

namespace std {
    template<class R>
    class future {
    public:
        future() noexcept;
        future(future&&) noexcept;
        future(const future&) = delete;
        ~future();
        future& operator=(const future&) = delete;
        future& operator=(future&&) noexcept;
        shared_future<R> share() noexcept;

§ 33.10.7 1908
// retrieving the value
see below get();

// functions to check state
bool valid() const noexcept;

void wait() const;
template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
}

4 For the primary template, R shall be an object type that meets the Cpp17Destructible requirements.

5 The implementation provides the template future and two specializations, future<R&> and future<void>. These differ only in the return type and return value of the member function get, as set out in its description, below.

future() noexcept;

6 Effects: The object does not refer to a shared state.

7 Postconditions: valid() == false.

future(future&& rhs) noexcept;

8 Effects: Move constructs a future object that refers to the shared state that was originally referred to by rhs (if any).

9 Postconditions:
(9.1) — valid() returns the same value as rhs.valid() prior to the constructor invocation.
(9.2) — rhs.valid() == false.

~future();

10 Effects:
(10.1) — Releases any shared state (33.10.5);
(10.2) — destroys *this.

future& operator=(future&& rhs) noexcept;

11 Effects: If addressof(rhs) == this is true, there are no effects. Otherwise:
(11.1) — Releases any shared state (33.10.5).
(11.2) — move assigns the contents of rhs to *this.

12 Postconditions:
(12.1) — valid() returns the same value as rhs.valid() prior to the assignment.
(12.2) — If addressof(rhs) == this is false, rhs.valid() == false.

shared_future<R> share() noexcept;

13 Postconditions: valid() == false.

14 Returns: shared_future<R>(std::move(*this)).

R future::get();
R& future<R&>::get();
void future<void>::get();

[Note 3: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

15 Effects:
(16.1) — wait()s until the shared state is ready, then retrieves the value stored in the shared state;
(16.2) — releases any shared state (33.10.5).
Postconditions: valid() == false.

Returns:

(18.1) future::get() returns the value v stored in the object’s shared state as std::move(v).
(18.2) future<R&>::get() returns the reference stored as value in the object’s shared state.
(18.3) future<void>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by rel_time has expired.

Returns:

(23.1) future_status::deferred if the shared state contains a deferred function.
(23.2) future_status::ready if the shared state is ready.
(23.3) future_status::timeout if the function is returning because the relative timeout (33.2.4) specified by rel_time has expired.

Throws: timeout-related exceptions (33.2.4).

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by abs_time has expired.

Returns:

(26.1) future_status::deferred if the shared state contains a deferred function.
(26.2) future_status::ready if the shared state is ready.
(26.3) future_status::timeout if the function is returning because the absolute timeout (33.2.4) specified by abs_time has expired.

Throws: timeout-related exceptions (33.2.4).

33.10.8 Class template shared_future

The class template shared_future defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed shared_future object has no shared state. A shared_future object with shared state can be created by conversion from a future object and shares its shared state with the original asynchronous provider (33.10.5) of the shared state. The result (value or exception) of a shared_future object can be set by calling a respective function on an object that shares the same shared state.

[Note 1: Member functions of shared_future do not synchronize with themselves, but they synchronize with the shared state. — end note]

The effect of calling any member function other than the destructor, the move-assignment operator, the copy-assignment operator, or valid() on a shared_future object for which valid() == false is undefined. [Note 2: It is valid to copy or move from a shared_future object for which valid() is false. — end note]

Recommended practice: Implementations should detect this case and throw an object of type future_error with an error condition of future_errc::no_state.

namespace std {
    template<class R>
    class shared_future {

§ 33.10.8 1910
public:
  shared_future() noexcept;
  shared_future(const shared_future& rhs) noexcept;
  shared_future(future<R>&& ) noexcept;
  shared_future(shared_future&& rhs) noexcept;
  ~shared_future();
  shared_future& operator=(const shared_future& rhs) noexcept;
  shared_future& operator=(shared_future&& rhs) noexcept;

  // retrieving the value
  see below get() const;

  // functions to check state
  bool valid() const noexcept;

  void wait() const;
  template<class Rep, class Period>
    future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
  template<class Clock, class Duration>
    future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
};

For the primary template, R shall be an object type that meets the Cpp17Destructible requirements.

The implementation provides the template shared_future and two specializations, shared_future<R&> and shared_future<void>. These differ only in the return type and return value of the member function get, as set out in its description, below.

shared_future() noexcept;
  Effects: The object does not refer to a shared state.
  Postconditions: valid() == false.

shared_future(const shared_future& rhs) noexcept;
  Effects: The object refers to the same shared state as rhs (if any).
  Postconditions: valid() returns the same value as rhs.valid().

shared_future(future<R>&& rhs) noexcept;
shared_future(shared_future&& rhs) noexcept;
  Effects: Move constructs a shared_future object that refers to the shared state that was originally referred to by rhs (if any).
  Postconditions:
  (11.1) valid() returns the same value as rhs.valid() returned prior to the constructor invocation.
  (11.2) rhs.valid() == false.

~shared_future();
  Effects:
  (12.1) Releases any shared state (33.10.5);
  (12.2) destroys *this.

shared_future& operator=(shared_future&& rhs) noexcept;
  Effects: If addressof(rhs) == this is true, there are no effects. Otherwise:
  (13.1) Releases any shared state (33.10.5);
  (13.2) move assigns the contents of rhs to *this.
  Postconditions:
  (14.1) valid() returns the same value as rhs.valid() returned prior to the assignment.
  (14.2) If addressof(rhs) == this is false, rhs.valid() == false.

§ 33.10.8
shared_future& operator=(const shared_future& rhs) noexcept;

15 Effects: If addressof(rhs) == this is true, there are no effects. Otherwise:
(15.1) — Releases any shared state (33.10.5);
(15.2) — assigns the contents of rhs to *this.

[Note 3: As a result, *this refers to the same shared state as rhs (if any). — end note]

16 Postconditions: valid() == rhs.valid().

const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;

[Note 4: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

17 [Note 5: Access to a value object stored in the shared state is unsynchronized, so operations on R might introduce a data race (6.9.2). — end note]

Effects: wait()s until the shared state is ready, then retrieves the value stored in the shared state.

18 Returns:
(20.1) — shared_future::get() returns a const reference to the value stored in the object’s shared state.

[Note 6: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the shared_future object that returned the reference. — end note]

(20.2) — shared_future<R&>::get() returns the reference stored as value in the object’s shared state.

(20.3) — shared_future<void>::get() returns nothing.

19 Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;

20 Returns: true only if *this refers to a shared state.

void wait() const;

21 Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

22 Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by rel_time has expired.

23 Returns:
(25.1) — future_status::deferred if the shared state contains a deferred function.
(25.2) — future_status::ready if the shared state is ready.
(25.3) — future_status::timeout if the function is returning because the relative timeout (33.2.4) specified by rel_time has expired.

24 Throws: timeout-related exceptions (33.2.4).

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;

25 Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by abs_time has expired.

26 Returns:
(28.1) — future_status::deferred if the shared state contains a deferred function.
(28.2) — future_status::ready if the shared state is ready.
(28.3) — future_status::timeout if the function is returning because the absolute timeout (33.2.4) specified by abs_time has expired.

27 Throws: timeout-related exceptions (33.2.4).

§ 33.10.8 1912
The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```cpp
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);
```

Mandates: The following are all true:

1. `is_constructible_v<decay_t<F>, F>`.
2. `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
3. `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

Effects: The first function behaves the same as a call to the second function with a `policy` argument of `launch::async | launch::deferred` and the same arguments for `F` and `Args`. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the `policy` argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

- If `launch::async` is set in `policy`, calls `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` (22.10.5, 33.4.3.3) as if in a new thread of execution represented by a `thread` object with the values produced by `auto` being materialized (7.3.5) in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.

- If `launch::deferred` is set in `policy`, stores `auto(std::forward<F>(f))` and `auto(std::forward<Args>(args))...` in the shared state. These copies of `f` and `args` constitute a deferred function. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `auto(std::forward<F>(f))` and `xyz` is the stored copy of `auto(std::forward<Args>(args))...`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (33.10.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred.

Recommended practice: If this policy is specified together with other policies, such as when using a `policy` value of `launch::async | launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

- If no value is set in the `launch policy`, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

Synchronization: The invocation of `async` synchronizes with the invocation of `f`. The completion of the function `f` is sequenced before the shared state is made ready.

[Note 1: These apply regardless of the provided `policy` argument, and even if the corresponding `future` object is moved to another thread. However, it is possible for `f` not to be called at all, in which case its completion never happens. — end note]

If the implementation chooses the `launch::async` policy,

- a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (33.4.3.6);

- the associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.
Returns: An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

[Note 2: If a future obtained from `async` is moved outside the local scope, the future's destructor can block for the shared state to become ready. — end note]

Throws: `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

Error conditions:

--- resource_unavailable_try_again — if `policy == launch::async` and the system is unable to start a new thread.

--- end example ---

### 33.10.10 Class template `packaged_task` [futures.task]

#### 33.10.10.1 General [futures.task.general]

1. The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.

2. When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) is stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```cpp
namespace std {
    template<class> class packaged_task; // not defined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)>
    {
        public:
            // construction and destruction
            packaged_task() noexcept;
            template<class F>
            explicit packaged_task(F&& f);
            ~packaged_task();

            // no copy
            packaged_task(const packaged_task&) = delete;
            packaged_task& operator=(const packaged_task&) = delete;

            // move support
            packaged_task(packaged_task&& rhs) noexcept;
            packaged_task& operator=(packaged_task&& rhs) noexcept;
            void swap(packaged_task& other) noexcept;

            bool valid() const noexcept;

            // result retrieval
            future<R> get_future();

            // execution
            void operator()(ArgTypes...);
            void make_ready_at_thread_exit(ArgTypes...);

```

§ 33.10.10.1 1914
33.10.10.2  Member functions

```cpp
packaged_task() noexcept;

```cpp}
```
future<R> get_future();

Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to operator() or 
make_ready_at_thread_exit.

[Note 1: Such calls need not synchronize with each other. — end note]

Returns: A future object that shares the same shared state as *this.

Throws: A future_error object if an error occurs.

Error conditions:
(19.1) — future_already_retrieved if get_future has already been called on a packaged_task object 
with the same shared state as *this.
(19.2) — no_state if *this has no shared state.

void operator()(ArgTypes... args);

Effects: As if by INVOKE<R>(t, t1, t2, ..., tN) (22.10.4), where f is the stored task of *this and
t1, t2, ..., tN are the values in args... If the task returns normally, the return value is stored as 
the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is 
stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the 
shared state of *this to become ready are unblocked.

Throws: A future_error exception object if there is no shared state or the stored task has already 
been invoked.

Error conditions:
(22.1) — promise_already_satisfied if the stored task has already been invoked.
(22.2) — no_state if *this has no shared state.

void make_ready_at_thread_exit(ArgTypes... args);

Effects: As if by INVOKE<R>(f, t, t1, t2, ..., tN) (22.10.4), where f is the stored task and t1, t2, 
..., tN are the values in args... If the task returns normally, the return value is stored as the 
asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. 
In either case, this is done without making that state ready (33.10.5) immediately. Schedules the shared 
state to be made ready when the current thread exits, after all objects of thread storage duration 
associated with the current thread have been destroyed.

Throws: future_error if an error condition occurs.

Error conditions:
(25.1) — promise_already_satisfied if the stored task has already been invoked.
(25.2) — no_state if *this has no shared state.

void reset();

Effects: As if *this = packaged_task(std::move(f)), where f is the task stored in *this.

[Note 2: This constructs a new shared state for *this. The old state is abandoned (33.10.5). — end note]

Throws:
(27.1) — bad_alloc if memory for the new shared state cannot be allocated.
(27.2) — Any exception thrown by the move constructor of the task stored in the shared state.
(27.3) — future_error with an error condition of no_state if *this has no shared state.

33.10.3 Globals [futures.task.nonmembers]

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;

Effects: As if by x.swap(y).
33.11 Safe reclamation

33.11.1 General

Subclause 33.11 contains safe-reclamation techniques, which are most frequently used to straightforwardly resolve access-deletion races.

33.11.2 Read-copy update (RCU)

33.11.2.1 General

RCU is a synchronization mechanism that can be used for linked data structures that are frequently read, but seldom updated. RCU does not provide mutual exclusion, but instead allows the user to schedule specified actions such as deletion at some later time.

A class type $T$ is rcu-protectable if it has exactly one base class of type $\text{rcu_obj_base}<T, D>$ for some $D$, and that base is public and non-virtual, and it has no base classes of type $\text{rcu_obj_base}<X, Y>$ for any other combination $X, Y$. An object is rcu-protectable if it is of rcu-protectable type.

An invocation of $\text{unlock} U$ on an $\text{rcu_domain} dom$ corresponds to an invocation of $\text{lock} L$ on $dom$ if $L$ is sequenced before $U$ and either

1. no other invocation of $\text{lock} L$ on $dom$ is sequenced after $L$ and before $U$, or
2. every invocation of $\text{unlock} U2$ on $dom$ such that $L$ is sequenced before $U2$ and $U2$ is sequenced before $U$ corresponds to an invocation of $\text{lock} L2$ on $dom$ such that $L$ is sequenced before $L2$ and $L2$ is sequenced before $U2$.

[Note 1: This pairs nested locks and unlocks on a given domain in each thread. — end note]

A region of RCU protection on a domain $dom$ starts with a $\text{lock} L$ on $dom$ and ends with its corresponding $\text{unlock} U$.

Given a region of RCU protection $R$ on a domain $dom$ and given an evaluation $E$ that scheduled another evaluation $F$ in $dom$, if $E$ does not strongly happen before the start of $R$, the end of $R$ strongly happens before evaluating $F$.

The evaluation of a scheduled evaluation is potentially concurrent with any other scheduled evaluation. Each scheduled evaluation is evaluated at most once.

33.11.2.2 Header <rcu> synopsis

```cpp
namespace std {
    // 33.11.2.3, class template \text{rcu_obj_base}
    template<class T, class D = default_delete<T>> class \text{rcu_obj_base};

    // 33.11.2.4, class \text{rcu_domain}
    class \text{rcu_domain};

    // 33.11.2.4.3 non-member functions
    \text{rcu_domain&} \text{rcu_default_domain}() noexcept;
    void \text{rcu_synchronize}(\text{rcu_domain&} dom = \text{rcu_default_domain}()) noexcept;
    void \text{rcu_barrier}(\text{rcu_domain&} dom = \text{rcu_default_domain}()) noexcept;
    template<class T, class D = default_delete<T>>
    void \text{rcu_retire}(T* p, D d = D(), \text{rcu_domain&} dom = \text{rcu_default_domain}());
}
```

33.11.2.3 Class template \text{rcu_obj_base}

Objects of type $T$ to be protected by RCU inherit from a specialization $\text{rcu_obj_base}<T, D>$ for some $D$.

```cpp
namespace std {
    template<class T, class D = default_delete<T>>
    class \text{rcu_obj_base} {
        public:
            void retire(D d = D(), \text{rcu_domain&} dom = \text{rcu_default_domain}()) noexcept;
        protected:
            \text{rcu_obj_base}() = default;
            \text{rcu_obj_base}(\text{rcu_obj_base&}) = default;
            \text{rcu_obj_base&} operator=(\text{const rcu_obj_base&}) = default;
    }
}
```
rcu_obj_base& operator=(rcu_obj_base&&) = default;
-rcu_obj_base() = default;

private:
  D deleter;  // exposition only
};

The behavior of a program that adds specializations for rcu_obj_base is undefined.

T may be an incomplete type. It shall be complete before any member of the resulting specialization of rcu_obj_base is referenced.

D shall be a function object type (22.10) for which, given a value d of type D and a value ptr of type T*, the expression d(ptr) is valid.

D shall meet the requirements for Cpp17DefaultConstructible and Cpp17MoveAssignable.

If D is trivially copyable, all specializations of rcu_obj_base<T, D> are trivially copyable.

void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;

Mandates: T is an rcu-protectable type.

Preconditions: *this is a base class subobject of an object x of type T. The member function rcu_obj_base<T, D>::retire was not invoked on x before. The assignment to deleter does not exit via an exception.

Effects: Evaluates deleter = std::move(d) and schedules the evaluation of the expression deleter(addressof(x)) in the domain dom; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in dom.

[Note 1: If such evaluations acquire resources held across any invocation of retire on dom, deadlock can occur. —end note]

33.11.2.4 Class rcu_domain

33.11.2.4.1 General

namespace std {

  class rcu_domain {
    public:
      rcu_domain(const rcu_domain&) = delete;
      rcu_domain& operator=(const rcu_domain&) = delete;

    void lock() noexcept;
    bool try_lock() noexcept;
    void unlock() noexcept;
  };
}

This class meets the requirements of Cpp17Lockable (33.2.5.3) and provides regions of RCU protection.

[Example 1:
  std::scoped_lock<rcu_domain> rlock(rcu_default_domain());
  —end example]

The functions lock and unlock establish (possibly nested) regions of RCU protection.

33.11.2.4.2 Member functions

void lock() noexcept;

Effects: Opens a region of RCU protection.

Remarks: Calls to lock do not introduce a data race (6.9.2.2) involving *this.

bool try_lock() noexcept;

Effects: Equivalent to lock().

Returns: true.
void unlock() noexcept;

Preconditions: A call to lock that opened an unclosed region of RCU protection is sequenced before the call to unlock.

Effects: Closes the unclosed region of RCU protection that was most recently opened. May invoke scheduled evaluations in *this.

[Note 1: If such evaluations acquire resources held across any invocation of unlock on *this, deadlock can occur. — end note]

Remarks: Calls to unlock do not introduce a data race involving *this.

[Note 2: Evaluation of scheduled evaluations can still cause a data race. — end note]

33.11.2.4.3 Non-member functions

rcu_domain& rcu_default_domain() noexcept;

Returns: A reference to a static-duration object of type rcu_domain. A reference to the same object is returned every time this function is called.

void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;

Effects: If the call to rcu_synchronize does not strongly happen before the lock opening an RCU protection region R on dom, blocks until the unlock closing R happens.

Synchronization: The unlock closing R strongly happens before the return from rcu_synchronize.

void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;

Effects: May evaluate any scheduled evaluations in dom. For any evaluation that happens before the call to rcu_barrier and that schedules an evaluation E in dom, blocks until E has been evaluated.

Synchronization: The evaluation of any such E strongly happens before the return from rcu_barrier.

[Note 1: A call to rcu_barrier does not imply a call to rcu_synchronize and vice versa. — end note]

template<class T, class D = default_delete<T>>
void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());

Mandates: is_move_constructible_v<D> is true and the expression d(p) is well-formed.

Preconditions: D meets the Cpp17MoveConstructible and Cpp17Destructible requirements.

Effects: May allocate memory. It is unspecified whether the memory allocation is performed by invoking operator new. Initializes an object d1 of type D from std::move(d). Schedules the evaluation of d1(p) in the domain dom; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in dom.

[Note 2: If rcu_retire exits via an exception, no evaluation is scheduled. — end note]

Throws: bad_alloc or any exception thrown by the initialization of d1.

[Note 3: If scheduled evaluations acquire resources held across any invocation of rcu_retire on dom, deadlock can occur. — end note]

33.11.3 Hazard pointers

33.11.3.1 General

A hazard pointer is a single-writer multi-reader pointer that can be owned by at most one thread at any time. Only the owner of the hazard pointer can set its value, while any number of threads may read its value. The owner thread sets the value of a hazard pointer to point to an object in order to indicate to concurrent threads—which may delete such an object—that the object is not yet safe to delete.

A class type T is hazard-protectable if it has exactly one base class of type hazard_pointer_obj_base<T, D> for some D, that base is public and non-virtual, and it has no base classes of type hazard_pointer_obj_base<T2, D2> for any other combination T2, D2. An object is hazard-protectable if it is of hazard-protectable type.

The time span between creation and destruction of a hazard pointer h is partitioned into a series of protection epochs; in each protection epoch, h either is associated with a hazard-protectable object, or is unassociated. Upon creation, a hazard pointer is unassociated. Changing the association (possibly to the same object) initiates a new protection epoch and ends the preceding one.
An object \( x \) of hazard-protectable type \( T \) is retired with a deleter of type \( D \) when the member function \( \text{hazard\_pointer\_obj\_base}\langle T, D \rangle::\text{retire} \) is invoked on \( x \). Any given object \( x \) shall be retired at most once.

A retired object \( x \) is reclaimed by invoking its deleter with a pointer to \( x \); the behavior is undefined if that invocation exits via an exception.

A hazard-protectable object \( x \) is possibly-reclaimable with respect to an evaluation \( A \) if:

1. \( x \) is not reclaimed; and
2. \( x \) is retired in an evaluation \( R \) and \( A \) does not happen before \( R \); and
3. for all hazard pointers \( h \) and for every protection epoch \( E \) of \( h \) during which \( h \) is associated with \( x \):
   1. if the beginning of \( E \) happens before \( R \), the end of \( E \) strongly happens before \( A \); and
   2. if \( E \) began by an evaluation of \text{try\_protect} with argument \( \text{src} \), label its atomic load operation \( L \). If there exists an atomic modification \( B \) on \( \text{src} \) such that \( L \) observes a modification that is modification-ordered before \( B \), and \( B \) happens before \( x \) is retired, the end of \( E \) strongly happens before \( A \).

\[ \text{Note 1: In typical use, a store to } \text{src} \text{ sequenced before retiring } x \text{ will be such an atomic operation } B. \]

\[ \text{—end note} \]

\[ \text{Note 2: The latter two conditions convey the informal notion that a protection epoch that began before retiring } x \text{, as implied either by the happens-before relation or the coherence order of some source, delays the reclamation of } x. \text{—end note} \]

The number of possibly-reclaimable objects has an unspecified bound.

\[ \text{Note 3: The bound can be a function of the number of hazard pointers, the number of threads that retire objects, and the number of threads that use hazard pointers. —end note} \]

\[ \text{Example 1: The following example shows how hazard pointers allow updates to be carried out in the presence of concurrent readers. The object of type } \text{hazard\_pointer} \text{ in } \text{print\_name} \text{ protects the object } *\text{ptr} \text{ from being reclaimed by } \text{ptr}->\text{retire} \text{ until the end of the protection epoch.} \]

```cpp
struct Name : public hazard_pointer_obj_base<Name> { /* details */
    atomic<Name*> name;
    // called often and in parallel!
    void print_name() {
        hazard_pointer h = make_hazard_pointer();
        Name* ptr = h.protect(name);   // Protection epoch starts
        // ... safe to access *ptr
    } // Protection epoch ends.

    // called rarely, but possibly concurrently with print\_name
    void update_name(Name* new_name) {
        Name* ptr = name.exchange(new_name);
        ptr->retire();
    }
}
```

33.11.3.2 Header \texttt{<hazard\_pointer>} synopsis

```cpp
namespace std {
    // 33.11.3.3, class template hazard\_pointer\_obj\_base
    template<class T, class D = default\_delete<T>> class hazard\_pointer\_obj\_base;

    // 33.11.3.4, class hazard\_pointer
    class hazard\_pointer;

    // 33.11.3.4.4, non-member functions
    hazard\_pointer make\_hazard\_pointer();
    void swap(hazard\_pointer&, hazard\_pointer&) noexcept;
}
```
33.11.3.3 Class template hazard_pointer_obj_base [saferecl.hp.base]

namespace std {
    template<class T, class D = default_delete<T>>
    class hazard_pointer_obj_base {
    public:
        void retire(D d = D()) noexcept;
    protected:
        hazard_pointer_obj_base() = default;
        hazard_pointer_obj_base(const hazard_pointer_obj_base&) = default;
        hazard_pointer_obj_base(hazard_pointer_obj_base&&) = default;
    private:
        D deleter; // exposition only
    };
}

1 D shall be a function object type (22.10.4) for which, given a value d of type D and a value ptr of type T*,
   the expression d(ptr) is valid.
2 The behavior of a program that adds specializations for hazard_pointer_obj_base is undefined.
3 T may be an incomplete type. It shall be complete before any member of the resulting specialization of
   hazard_pointer_obj_base is referenced.
4 void retire(D d = D()) noexcept;
5 Mandates: T is a hazard-protectable type.
6 Preconditions: *this is a base class subobject of an object x of type T. x is not retired. Move-assigning
   d to deleter does not exit via an exception.
7 Effects: Move-assigns d to deleter, thereby setting it as the deleter of x, then retires x. May reclaim
   possibly-reclaimable objects.

33.11.3.4 Class hazard_pointer [saferecl.hp.holder]
33.11.3.4.1 General [saferecl.hp.holder.general]

namespace std {
    class hazard_pointer {
    public:
        hazard_pointer() noexcept;
        hazard_pointer(hazard_pointer&&) noexcept;
        hazard_pointer& operator=(hazard_pointer&&) noexcept;
        ~hazard_pointer();

        [[nodiscard]] bool empty() const noexcept;
        template<class T> T* protect(const atomic<T*>& src) noexcept;
        template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;
        template<class T> void reset_protection(const T* ptr) noexcept;
        void reset_protection(nullptr_t = nullptr) noexcept;
        void swap(hazard_pointer&) noexcept;
    };
}

1 An object of type hazard_pointer is either empty or owns a hazard pointer. Each hazard pointer is owned
   by exactly one object of type hazard_pointer.
   [Note 1: An empty hazard_pointer object is different from a hazard_pointer object that owns an unassociated
    hazard pointer. An empty hazard_pointer object does not own any hazard pointers. — end note]

33.11.3.4.2 Constructors, destructor, and assignment [saferecl.hp.holder.ctor]

hazard_pointer() noexcept;
1 Postconditions: *this is empty.
hazard_pointer(hazard_pointer&& other) noexcept;

Postconditions: If other is empty, *this is empty. Otherwise, *this owns the hazard pointer originally owned by other; other is empty.

~hazard_pointer();

Effects: If *this is not empty, destroys the hazard pointer owned by *this, thereby ending its current protection epoch.

hazard_pointer& operator=(hazard_pointer&& other) noexcept;

Effects: If this == &other is true, no effect. Otherwise, if *this is not empty, destroys the hazard pointer owned by *this, thereby ending its current protection epoch.

Postconditions: If other was empty, *this is empty. Otherwise, *this owns the hazard pointer originally owned by other. If this != &other is true, other is empty.

Returns: *this.

33.11.3.4.3 Member functions

[[nodiscard]] bool empty() const noexcept;

Returns: true if and only if *this is empty.

template<class T> T* protect(const atomic<T*>& src) noexcept;

Effects: Equivalent to:

T* ptr = src.load(memory_order::relaxed);
while (!try_protect(ptr, src)) {}
return ptr;

template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;

Mandates: T is a hazard-protectable type.

Preconditions: *this is not empty.

Effects: Performs the following steps in order:

- (5.1) Initializes a variable old of type T* with the value of ptr.
- (5.2) Evaluates reset_protection(old).
- (5.3) Assigns the value of src.load(memory_order::acquire) to ptr.
- (5.4) If old == ptr is false, evaluates reset_protection().

Returns: old == ptr.

template<class T> void reset_protection(const T* ptr) noexcept;

Mandates: T is a hazard-protectable type.

Preconditions: *this is not empty.

Effects: If ptr is a null pointer value, invokes reset_protection(). Otherwise, associates the hazard pointer owned by *this with *ptr, thereby ending the current protection epoch.

Complexity: Constant.

void reset_protection(nullptr_t = nullptr) noexcept;

Preconditions: *this is not empty.

Postconditions: The hazard pointer owned by *this is unassociated.

Complexity: Constant.

void swap(hazard_pointer& other) noexcept;

Effects: Swaps the hazard pointer ownership of this object with that of other.

[Note 1: The owned hazard pointers, if any, remain unchanged during the swap and continue to be associated with the respective objects that they were protecting before the swap, if any. No protection epochs are ended or initiated. — end note]
Complexity: Constant.

33.11.3.4.4 Non-member functions

hazard_pointer make_hazard_pointer();

Effects: Constructs a hazard pointer.

Returns: A hazard_pointer object that owns the newly-constructed hazard pointer.

Throws: May throw bad_alloc if memory for the hazard pointer could not be allocated.

void swap(hazard_pointer& a, hazard_pointer& b) noexcept;

Effects: Equivalent to a.swap(b).
Annex A  (informative)
Grammar summary

A.1 General

This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

A.2 Keywords

New context-dependent keywords are introduced into a program by typedef (9.2.4), namespace (9.8.2), class (Clause 11), enumeration (9.7.1), and template (Clause 13) declarations.

A.3 Lexical conventions

n-char: one of any member of the translation character set except the U+007D RIGHT CURLY BRACKET or new-line character

Annex B  (normative)
Implementation quantities [implimits]

1 Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.

2 The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.

- Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
- Nesting levels of conditional inclusion (15.2) [256].
- Pointer (9.3.4.2), pointer-to-member (9.3.4.4), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a type in a declaration [256].
- Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].
- Number of characters in an internal identifier (5.10) or macro name (15.6) [1024].
- Number of characters in an external identifier (5.10, 6.6) [1024].
- External identifiers (6.6) in one translation unit [65536].
- Identifiers with block scope declared in one block (6.4.3) [1024].
- Structured bindings (9.6) introduced in one declaration [256].
- Macro identifiers (15.6) simultaneously defined in one translation unit [65536].
- Parameters in one function definition (9.5.1) [256].
- Arguments in one function call (7.6.1.3) [256].
- Parameters in one macro definition (15.6) [256].
- Arguments in one macro invocation (15.6) [256].
- Characters in one logical source line (5.2) [65536].
- Characters in a string-literal (5.13.5) (after concatenation (5.2)) [65536].
- Size of an object (6.7.2) [262144].
- Nesting levels for #include files (15.3) [256].
- Case labels for a switch statement (8.5.3) (excluding those for any nested switch statements) [16384].
- Non-static data members (including inherited ones) in a single class (11.4) [16384].
- Lambda-captures in one lambda-expression (7.5.5.3) [256].
- Enumeration constants in a single enumeration (9.7.1) [4096].
- Levels of nested class definitions (11.4.12) in a single member-specification [256].
- Functions registered by atexit() (17.5) [32].
- Functions registered by at_quick_exit() (17.5) [32].
- Direct and indirect base classes (11.7) [16384].
- Direct base classes for a single class (11.7) [1024].
- Class members declared in a single member-specification (including member functions) (11.4) [4096].
- Final overriding virtual functions in a class, accessible or not (11.7.3) [16384].
- Direct and indirect virtual bases of a class (11.7.2) [1024].
— Static data members of a class (11.4.9.3) [1024].
— Friend declarations in a class (11.8.4) [4096].
— Access control declarations in a class (11.8.2) [4096].
— Member initializers in a constructor definition (11.9.3) [6144].
— \textit{initializer-clauses} in one \textit{braced-init-list} (9.4) [16384].
— Scope qualifications of one identifier (7.5.4.3) [256].
— Nested \textit{linkage-specifications} (9.11) [1024].
— Recursive \texttt{constexpr} function invocations (9.2.6) [512].
— Full-expressions evaluated within a core constant expression (7.7) [1048576].
— Template parameters in a template declaration (13.2) [1024].
— Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1024].
— Handlers per try block (14.4) [256].
— Number of placeholders (22.10.15.5) [10].
— Number of hazard-protectable possibly-reclaimable objects (33.11.3.1) [256].

Implementation quantities

1948
Annex C  (informative)
Compatibility

C.1  C++ and ISO C++ 2023  [diff.cpp23]
C.1.1  General  [diff.cpp23.general]

Subclause C.1 lists the differences between C++ and ISO C++ 2023 (ISO/IEC 14882:2023, Programming Languages — C++), by the chapters of this document.

C.1.2  Clause 7: expressions  [diff.cpp23.expr]

Affected subclause: 9.4.5
Change: Pointer comparisons between initializer_list objects’ backing arrays are unspecified.
Rationale: Permit the implementation to store backing arrays in static read-only memory.
Effect on original feature: Valid C++ 2023 code that relies on the result of pointer comparison between backing arrays may change behavior. For example:

```c++
bool ne(std::initializer_list<int> a, std::initializer_list<int> b) {
    return a.begin() != b.begin() + 1;
}
bool b = ne({2,3}, {1,2,3}); // unspecified result; previously false
```

C.1.3  Clause 23: strings library  [diff.cpp23.strings]

Affected subclause: 23.4.5
Change: Output of floating-point overloads of to_string and to_wstring.
Rationale: Prevent loss of information and improve consistency with other formatting facilities.
Effect on original feature: to_string and to_wstring function calls that take floating-point arguments may produce a different output. For example:

```c++
auto s = std::to_string(1e-7); // *le-07* 
// previously "0.000000" with "." possibly 
// changed according to the global C locale
```

C.2  C++ and ISO C++ 2020  [diff.cpp20]
C.2.1  General  [diff.cpp20.general]

Subclause C.2 lists the differences between C++ and ISO C++ 2020 (ISO/IEC 14882:2020, Programming Languages — C++), by the chapters of this document.

C.2.2  Clause 5: lexical conventions  [diff.cpp20.lex]

Affected subclause: 5.10
Change: Previously valid identifiers containing characters not present in UAX #44 properties XID_Start or XID_Continue, or not in Normalization Form C, are now rejected.
Rationale: Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.
Effect on original feature: Some identifiers are no longer well-formed.

Affected subclause: 5.13.5
Change: Concatenated string-literals can no longer have conflicting encoding-prefixes.
Rationale: Removal of unimplemented conditionally-supported feature.
Effect on original feature: Concatenation of string-literals with different encoding-prefixes is now ill-formed.
For example:

```c++
auto c = L"a" U"b"; // was conditionally-supported; now ill-formed
```

C.2.3  Clause 7: expressions  [diff.cpp20(expr)]

Affected subclause: 7.5.4.2
Change: Change move-eligible id-expressions from lvalues to xvalues.
Rationale: Simplify the rules for implicit move.

Effect on original feature: Valid C++ 2020 code that relies on a returned id-expression's being an lvalue may change behavior or fail to compile. For example:

```cpp
decype(auto) f(int&& x) { return (x); }  // returns int&&; previously returned int
int g(int&& x) { return x; }             // ill-formed; previously well-formed
```

2 Affected subclause: 7.6.1.2
Change: Change the meaning of comma in subscript expressions.

Rationale: Enable repurposing a deprecated syntax to support multidimensional indexing.

Effect on original feature: Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile. For example:

```cpp
arr[1, 2]       // was equivalent to arr[(1, 2)],
                 // now equivalent to arr.operator[](1, 2) or ill-formed
```

C.2.4 Clause 8: statements [diff.cpp20.stmt]

1 Affected subclause: 8.6.5
Change: The lifetime of temporary objects in the for-range-initializer is extended until the end of the loop (6.7.7).

Rationale: Improve usability of the range-based for statement.

Effect on original feature: Destructors of some temporary objects are invoked later. For example:

```cpp
void f() {
    std::vector<int> v = { 42, 17, 13 };  
    std::mutex m;  

    for (int x :  
         static_cast<void>(std::lock_guard<std::mutex>(m), v) {   // lock released in C++ 2020
        std::lock_guard<std::mutex> guard(m);                    // OK in C++ 2020, now deadlocks
    }
}
```

C.2.5 Clause 9: declarations [diff.cpp20.dcl]

1 Affected subclause: 9.4.3
Change: UTF-8 string literals may initialize arrays of char or unsigned char.

Rationale: Compatibility with previously written code that conformed to previous versions of this document.

Effect on original feature: Arrays of char or unsigned char may now be initialized with a UTF-8 string literal. This can affect initialization that includes arrays that are directly initialized within class types, typically aggregates. For example:

```cpp
struct A {
    char s[10];  
};
struct B {
    char s[10];  
};

void f(A);  
void f(B);  

int main() {
    f({u8""});   // ambiguous
}
```

C.2.6 Clause 13: templates [diff.cpp20.temp]

1 Affected subclause: 13.10.3.6
Change: Deducing template arguments from exception specifications.

Rationale: Facilitate generic handling of throwing and non-throwing functions.

Effect on original feature: Valid ISO C++ 2020 code may be ill-formed in this revision of C++. For example:

```cpp
template<bool> struct A { };  
template<bool B> void f(void (*)(A<B>) noexcept(B));
```
void g(A<false>) noexcept;
void h() {
    f(g);
    // ill-formed; previously well-formed
}

C.2.7 Clause 16: library introduction [diff.cpp20.library]

Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: <expected> (22.8.2), <flat_map> (24.6.4), <flat_set> (24.6.5), <generator> (26.8.2), <print> (31.7.4), <spanstream> (31.9.2), <stacktrace> (19.6.2), and <stdatomic.h> (33.5.12). Valid C++ 2020 code that #includes headers with these names may be invalid in this revision of C++.

C.2.8 Clause 18: concepts library [diff.cpp20.concepts]

Affected subclauses: 17.11.4, 18.5.4, and 18.5.5
Change: Replace common_reference_with in three_way_comparable_with, equality_comparable_with, and totally_ordered_with with an exposition-only concept.
Rationale: Allow uncopyable, but movable, types to model these concepts.
Effect on original feature: Valid C++ 2020 code relying on subsumption with common_reference_with may fail to compile in this revision of C++. For example:

```cpp
template<class T, class U>
requires equality_comparable_with<T, U>
bool attempted_equals(const T& t, const U& u); // previously selected overload
```

```cpp
template<class T, class U>
requires common_reference_with<const remove_reference_t<T>&, const remove_reference_t<U>&>
bool attempted_equals(const T& t, const U& u); // ambiguous overload; previously
// rejected by partial ordering
```

```cpp
bool test(shared_ptr<int> p) {
    return attempted_equals(p, nullptr);
    // ill-formed; previously well-formed
}
```

C.2.9 Clause 20: memory management library [diff.cpp20.memory]

Affected subclause: 20.2.9.1
Change: Forbid partial and explicit program-defined specializations of allocator_traits.
Rationale: Allow addition of allocate_at_least to allocator_traits, and potentially other members in the future.
Effect on original feature: Valid C++ 2020 code that partially or explicitly specializes allocator_traits is ill-formed with no diagnostic required in this revision of C++.

C.2.10 Clause 22: general utilities library [diff.cpp20.utilities]

Affected subclause: 22.14
Change: Signature changes: format, format_to, vformat_to, format_to_n, formatted_size. Removal of format_args_t.
Rationale: Improve safety via compile-time format string checks, avoid unnecessary template instantiations.
Effect on original feature: Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or format_args_t may become ill-formed. For example:

```cpp
auto s = std::format("{:d}", "I am not a number"); // ill-formed,
// previously threw format_error
```

```cpp
auto s = std::format("{:d}", "I am not a number"); // ill-formed,
// previously threw format_error
```

Change: Signature changes: format, format_to, format_to_n, formatted_size.
Rationale: Enable formatting of views that do not support iteration when const-qualified and that are not copyable.
Effect on original feature: Valid C++ 2020 code that passes bit fields to formatting functions may become ill-formed. For example:
N4958

© ISO/IEC

struct tiny {
int bit: 1;
};
auto t = tiny();
std::format("{}", t.bit);
3

// ill-formed, previously returned "0"

Affected subclause: 22.14.2.2
Change: Restrict types of formatting arguments used as width or precision in a std-format-spec.
Rationale: Disallow types that do not have useful or portable semantics as a formatting width or precision.
Effect on original feature: Valid C++ 2020 code that passes a boolean or character type as arg-id becomes
invalid. For example:
std::format("{:*^{}}", "", true);
std::format("{:*^{}}", "", '1');

4

// ill-formed, previously returned "*"
// ill-formed, previously returned an
// implementation-defined number of ’*’ characters

Affected subclause: 22.14.6.3
Change: Removed the formatter specialization:
template<size_t N> struct formatter<const charT[N], charT>;

Rationale: The specialization is inconsistent with the design of formatter, which is intended to be
instantiated only with cv-unqualified object types.
Effect on original feature: Valid C++ 2020 code that instantiated the removed specialization can become
ill-formed.

C.2.11
1

Clause 23: strings library

[diff.cpp20.strings]

Affected subclause: 23.4
Change: Additional rvalue overload for the substr member function and the corresponding constructor.
Rationale: Improve efficiency of operations on rvalues.
Effect on original feature: Valid C++ 2020 code that created a substring by calling substr (or the
corresponding constructor) on an xvalue expression with type S that is a specialization of basic_string
may change meaning in this revision of C++. For example:
std::string s1 = "some long string that forces allocation", s2 = s1;
std::move(s1).substr(10, 5);
assert(s1 == s2);
// unspecified, previously guaranteed to be true
std::string s3(std::move(s2), 10, 5);
assert(s1 == s2);
// unspecified, previously guaranteed to be true

C.2.12
1

Clause 24: containers library

[diff.cpp20.containers]

Affected subclauses: 24.2.7 and 24.2.8
Change: Heterogeneous extract and erase overloads for associative containers.
Rationale: Improve efficiency of erasing elements from associative containers.
Effect on original feature: Valid C++ 2020 code may fail to compile in this revision of C++. For example:
struct B {
auto operator<=>(const B&) const = default;
};
struct D : private B {
void f(std::set<B, std::less<>>& s) {
s.erase(*this);
// ill formed; previously well-formed
}
};

C.2.13
1

Clause 33: concurrency support library

[diff.cpp20.thread]

Affected subclause: 33.9.3
Change: In this revision of C++, it is implementation-defined whether a barrier’s phase completion step
runs if no thread calls wait. Previously the phase completion step was guaranteed to run on the last thread
that calls arrive or arrive_and_drop during the phase. In this revision of C++, it can run on any of the
threads that arrived or waited at the barrier during the phase.
Rationale: Correct contradictory wording and improve implementation flexibility for performance.
Effect on original feature: Valid C++ 2020 code using a barrier might have different semantics in this
§ C.2.13

1952


C.3 C++ and ISO C++ 2017

C.3.1 General

Subclause C.3 lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, 
Programming Languages — C++), by the chapters of this document.

C.3.2 Clause 5: lexical conventions

Affected subclauses: 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5
Change: New identifiers with special meaning.
Rationale: Required for new features.
Effect on original feature: Logical lines beginning with module or import may be interpreted differently in this revision of C++. For example:

```cpp
class module {};
module m1; // was variable declaration; now module-declaration
module *m2; // variable declaration

class import {};
import j1; // was variable declaration; now module-import-declaration
::import j2; // variable declaration
```

Affected subclause: 5.8
Change: header-name tokens are formed in more contexts.
Rationale: Required for new features.
Effect on original feature: When the identifier import is followed by a < character, a header-name token may be formed. For example:

```cpp
template<typename> class import {};
import<int> f(); // ill-formed; previously well-formed
::import<int> g(); // OK
```

Affected subclause: 5.11
Change: New keywords.
Rationale: Required for new features.

(3.1) — The char8_t keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
(3.2) — The concept keyword is added to enable the definition of concepts (13.7.9).
(3.3) — The consteval keyword is added to declare immediate functions (9.2.6).
(3.4) — The constexpr keyword is added to prevent unintended dynamic initialization (9.2.7).
(3.5) — The co_await, co_yield, and co_return keywords are added to enable the definition of coroutines (9.5.4).
(3.6) — The requires keyword is added to introduce constraints through a requires-clause (13.1) or a requires-expression (7.5.7).

Effect on original feature: Valid C++ 2017 code using char8_t, concept, constexpr, constinit, co_await, co_yield, co_return, or requires as an identifier is not valid in this revision of C++.

Affected subclause: 5.12
Change: New operator <=>.
Rationale: Necessary for new functionality.
Effect on original feature: Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++. For example:

```cpp
namespace N {
  struct X {
    bool operator<=(X, X);
    template<bool(X, X)> struct Y {}
    Y<operator<=> y;  // ill-formed; previously well-formed
  }
}
```

Affected subclause: 5.13

Change: Type of UTF-8 string and character literals.

Rationale: Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.

Effect on original feature: Valid C++ 2017 code that depends on UTF-8 string literals having type “array of const char” and UTF-8 character literals having type “char” is not valid in this revision of C++. For example:

```cpp
const auto *u8s = u8"text";    // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s;           // ill-formed; previously well-formed
auto u8c = u8'c';               // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c;                // ill-formed; previously well-formed
std::string s = u8"text";      // ill-formed; previously well-formed

void f(const char *s);
f(u8"text");                    // ill-formed; previously well-formed
```

C.3.3 Clause 6: basics

1

Affected subclause: 6.7.3

Change: A pseudo-destructor call ends the lifetime of the object to which it is applied.

Rationale: Increase consistency of the language model.

Effect on original feature: Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++. For example:

```cpp
int f() {
  int a = 123;
  using T = int;
  a.-T();
  return a;  // undefined behavior; previously returned 123
}
```

2

Affected subclause: 6.9.2.2

Change: Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.

Rationale: Removal of rarely used and confusing feature.

Effect on original feature: If a `memory_order_release` atomic store is followed by a `memory_order_-relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_-_acquire` load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

C.3.4 Clause 7: expressions

1

Affected subclause: 7.5.5.3

Change: Implicit lambda capture may capture additional entities.

Rationale: Rule simplification, necessary to resolve interactions with constexpr if.

Effect on original feature: Lambdas with a `capture-default` may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.
C.3.5 Clause 9: declarations

1 Affected subclause: 9.2.4
Change: Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.
Rationale: Necessary for implementability.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++. For example:

```cpp
typedef struct {
    void f() {} // ill-formed; previously well-formed
} S;
```

2 Affected subclause: 9.3.4.7
Change: A function cannot have different default arguments in different translation units.
Rationale: Required for modules support.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required. For example:

```cpp
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; } // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); } // used to return 42
```

3 Affected subclause: 9.4.2
Change: A class that has user-declared constructors is never an aggregate.
Rationale: Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.
Effect on original feature: Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++. For example:

```cpp
struct A {
    A() = delete; // not an aggregate; previously an aggregate
};

struct B {
    B() = default; // not an aggregate; previously an aggregate
    int i = 0;
};

struct C {
    C(C&&) = default; // not an aggregate; previously an aggregate
    int a, b;
};

A a{}; // ill-formed; previously well-formed
B b = {1}; // ill-formed; previously well-formed
auto* c = new C{2, 3}; // ill-formed; previously well-formed

struct Y;

struct X {
    operator Y();
};

struct Y { // not an aggregate; previously an aggregate
    Y(const Y&) = default;
    X x;
};

Y y{x{}}; // copy constructor call; previously aggregate-initialization
```

4 Affected subclause: 9.4.5
Change: Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.
Rationale: Catches bugs.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
bool y[] = { "bc" };  // ill-formed; previously well-formed
```

C.3.6 Clause 11: classes

Affected subclauses: 11.4.5 and 11.4.8.3

Change: The class name can no longer be used parenthesized immediately after an `explicit decl-specifier` in a constructor declaration. The conversion-function-id can no longer be used parenthesized immediately after an `explicit decl-specifier` in a conversion function declaration.

Rationale: Necessary for new functionality.

Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
struct S {
    explicit (S)(const S&);  // ill-formed; previously well-formed
    explicit (operator int)(); // ill-formed; previously well-formed
    explicit(true) (S)(int);   // OK
};
```

Affected subclauses: 11.4.5 and 11.4.7

Change: A `simple-template-id` is no longer valid as the declarator-id of a constructor or destructor.

Rationale: Remove potentially error-prone option for redundancy.

Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
template<class T>
struct A {
    A<T>();          // error: simple-template-id not allowed for constructor
    A(int);          // OK, injected-class-name used
    ~A<T>();        // error: simple-template-id not allowed for destructor
};
```

Affected subclause: 11.9.6

Change: A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.

Rationale: Side effect of making it easier to write more efficient code that takes advantage of moves.

Effect on original feature: Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++. For example:

```cpp
struct base {
    base();
    base(base const &);
private:
    base(base &&);
};

struct derived : base {};

base f(base b) {
    throw b;
    // error: base(base &&) is private
    derived d;
    return d;  // error: base(base &&) is private
}

struct S {
    S(const char *s) : m(s) { }
    S(const S&) = default;
    S(S&& other) : m(other.m) { other.m = nullptr; }
    const char * m;
};

S consume(S&& s) { return s; }

void g() {
    S s("text");
}
```
consume(static_cast<S&&>(s));
char c = *s.m;    // undefined behavior; previously ok
}

C.3.7 Clause 12: overloading

Affected subclause: 12.2.2.3
Change: Equality and inequality expressions can now find reversed and rewritten candidates.
Rationale: Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.
Effect on original feature: For certain pairs of types where one is convertible to the other, equality or inequality expressions between an object of one type and an object of the other type invoke a different operator. Also, for certain types, equality or inequality expressions between two objects of that type become ambiguous. For example:

```cpp
struct A {
    operator int() const;
};

bool operator==(A, int);    // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
    return (x == y) +    // ill-formed; previously well-formed
        (10 == x) +    // calls #1, previously selected #2
        (10 != x);    // calls #1, previously selected #3
}
```

Affected subclause: 12.2.2.3
Change: Overload resolution may change for equality operators (7.6.10).
Rationale: Support calling `operator==` with reversed order of arguments.
Effect on original feature: Valid C++ 2017 code that uses equality operators with conversion functions may be ill-formed or have different semantics in this revision of C++. For example:

```cpp
struct A {
    operator int() const { return 10; }
};

bool operator==(A, int);    // #1
// #2 is built-in candidate: bool operator==(int, int);
bool b = 10 == A();    // calls #1 with reversed order of arguments; previously selected #2

struct B {
    bool operator==(const B&);    // member function with no cv-qualifier
};
B b1;
bool eq = (b1 == b1);    // ambiguous; previously well-formed
```

C.3.8 Clause 13: templates

Affected subclause: 13.3
Change: An `unqualified-id` that is followed by a `<` and for which name lookup finds nothing or finds a function will be treated as a `template-name` in order to potentially cause argument dependent lookup to be performed.
Rationale: It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.
Effect on original feature: Previously valid code that uses a function name as the left operand of a `<` operator would become ill-formed. For example:

```cpp
struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
    A a;
```
C.3.9 Clause 14: exception handling  [diff.cpp17.except]

1  Affected subclause: 14.5
Change: Remove throw() exception specification.
Rationale: Removal of obsolete feature that has been replaced by noexcept.
Effect on original feature: A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses throw() for its exception specification will be rejected as ill-formed in this revision of C++. It should simply be replaced with noexcept for no change of meaning since C++ 2017.

[Note 1: There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — end note]

C.3.10 Clause 16: library introduction  [diff.cpp17.library]

1  Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: <barrier> (33.9.3.2), <bit> (22.15.2), <charconv> (22.13.1), <compare> (17.11.1), <concepts> (18.3), <coroutine> (17.12.2), <format> (22.14.1), <latch> (33.9.2.2), <numbers> (28.8.1), <ranges> (26.2), <semaphore> (33.8.2), <source_location> (17.8.1), <span> (24.7.2.1), <stop_token> (33.3.2), <syncstream> (31.11.1), and <version> (17.3.1). Valid C++ 2017 code that #includes headers with these names may be invalid in this revision of C++.

2  Affected subclause: 16.4.2.3
Change: Remove vacuous C++ header files.
Rationale: The empty headers implied a false requirement to achieve C compatibility with the C++ headers.
Effect on original feature: A valid C++ 2017 program that #includes any of the following headers may fail to compile: <ccomplex>, <ciso646>, <cstdalign>, <cstdebool>, and <ctgmath>. To retain the same behavior:

- a #include of <ccomplex> can be replaced by a #include of <complex> (28.4.2),
- a #include of <ctgmath> can be replaced by a #include of <cmath> (28.7.1) and a #include of <complex>, and
- a #include of <ciso646>, <cstdalign>, or <cstdebool> can simply be removed.

C.3.11 Clause 24: containers library  [diff.cpp17.containers]

1  Affected subclauses: 24.3.9 and 24.3.10
Change: Return types of remove, remove_if, and unique changed from void to container::size_type.
Rationale: Improve efficiency and convenience of finding number of removed elements.
Effect on original feature: Code that depends on the return types might have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

C.3.12 Clause 25: iterators library  [diff.cpp17.iterators]

1  Affected subclause: 25.3.2.3
Change: The specialization of iterator_traits for void* and for function pointer types no longer contains any nested typedefs.
Rationale: Corrects an issue misidentifying pointer types that are not incrementable as iterator types.
Effect on original feature: A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

C.3.13 Clause 27: algorithms library  [diff.cpp17.alg.reqs]

1  Affected subclause: 27.2
Change: The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.
Rationale: Increase implementor freedom and allow some function templates to be implemented as function
objects with templated call operators.

**Effect on original feature:** A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

### C.3.14 Clause 31: input/output library

#### Affected subclause: 31.7.5.3.3

**Change:** Character array extraction only takes array types.

**Rationale:** Increase safety via preventing buffer overflow at compile time.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p; // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q; // OK
```

#### Affected subclause: 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with UTF-8 literals.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2017 code that passes UTF-8 literals to `basic_ostream<char, ...>::operator<<` or `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed. For example:

```cpp
std::cout << u8"text"; // previously called operator<<(const char*) and printed a string;
// now ill-formed
std::cout << u8'X'; // previously called operator<<(char) and printed a character;
// now ill-formed
```

#### Affected subclause: 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with `wchar_t`, `char16_t`, or `char32_t` types.

**Rationale:** Removal of surprising behavior.

**Effect on original feature:** Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed. For example:

```cpp
std::cout << u"text"; // previously formatted the string as a pointer value;
// now ill-formed
std::cout << u'X'; // previously formatted the character as an integer value;
// now ill-formed
```

#### Affected subclause: 31.12.6

**Change:** Return type of filesystem path format observer member functions.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++. For example:

```cpp
std::filesystem::path p;
std::string s1 = p.u8string(); // ill-formed; previously well-formed
std::string s2 = p.generic_u8string(); // ill-formed; previously well-formed
```

### C.3.15 Annex D: compatibility features

#### Change: Remove`uncaught_exception`

**Rationale:** The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.

**Effect on original feature:** A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It can be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.

#### Change: Remove support for adaptable function API

**Rationale:** The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`, and by the `std::bind` and `std::not_fn` function templates.

**Effect on original feature:** A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.
3 Change: Remove redundant members from `std::allocator`.
   Rationale: `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.
   Effect on original feature: A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

4 Change: Remove `raw_storage_iterator`.
   Rationale: The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, as would be necessary to destroy them.
   Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

5 Change: Remove temporary buffers API.
   Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.
   Effect on original feature: A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

6 Change: Remove `shared_ptr::unique`.
   Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well-defined use in single-threaded cases.
   Effect on original feature: A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

7 Affected subclause: D.18
   Change: Remove deprecated type traits.
   Rationale: The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that did not directly support function types. It has been superseded by the `invoke_result` trait.
   Effect on original feature: A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

C.4 C++ and ISO C++ 2014

C.4.1 General

C.4.2 Clause 5: lexical conventions

1 Affected subclause: 5.2
   Change: Removal of trigraph support as a required feature.
   Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.
   Effect on original feature: Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from input source file characters to the translation character set.

2 Affected subclause: 5.9
   Change: `pp-number` can contain `p` sign and `P` sign.
   Rationale: Necessary to enable `hexadecimal-floating-point-literals`.
   Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this revision of C++. For example:

   ```cpp
   #define F(a) b ## a
   int b0p = F(0p+0); // ill-formed; equivalent to “int b0p = b0p + 0;” in C++ 2014
   ```

§ C.4.2 1960
C.4.3 Clause 7: expressions

1 Affected subclauses: 7.6.1.6 and 7.6.2.3
Change: Remove increment operator with bool operand.
Rationale: Obsolete feature with occasionally surprising semantics.
Effect on original feature: A valid C++ 2014 expression utilizing the increment operator on a bool lvalue is ill-formed in this revision of C++.

2 Affected subclauses: 7.6.2.8 and 7.6.2.9
Change: Dynamic allocation mechanism for over-aligned types.
Rationale: Simplify use of over-aligned types.
Effect on original feature: In C++ 2014 code that uses a new-expression to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, ::operator new(std::size_t) is used to allocate the memory. In this revision of C++, ::operator new(std::size_t, std::align_val_t) is used instead.

C.4.4 Clause 9: declarations

1 Affected subclause: 9.2.2
Change: Removal of register storage-class-specifier.
Rationale: Enable repurposing of deprecated keyword in future revisions of C++.
Effect on original feature: A valid C++ 2014 declaration utilizing the register storage-class-specifier is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.

2 Affected subclause: 9.2.9.6
Change: auto deduction from braced-init-list.
Rationale: More intuitive deduction behavior.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```cpp
auto x1{1}; // was std::initializer_list<int>, now int
auto x2{1, 2}; // was std::initializer_list<int>, now ill-formed
```

3 Affected subclause: 9.3.4.6
Change: Make exception specifications be part of the type system.
Rationale: Improve type-safety.
Effect on original feature: Valid C++ 2014 code may fail to compile or change meaning in this revision of C++. For example:

```cpp
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2); // ill-formed; previously well-formed
```

4 Affected subclause: 9.4.2
Change: Definition of an aggregate is extended to apply to user-defined types with base classes.
Rationale: To increase convenience of aggregate initialization.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:

```cpp
struct derived;
struct base {
    friend struct derived;
private:
    base();
};
struct derived : base {};
```

```
derived d1{}; // error; the code was well-formed in C++ 2014
derived d2;  // still OK
```

C.4.5 Clause 11: classes

1 Affected subclause: 11.9.4
Change: Inheriting a constructor no longer injects a constructor into the derived class.
Rationale: Better interaction with other language features.
Effect on original feature: Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A using-declaration that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors. For example:

```cpp
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};
struct B : A {
    using A::A;
    B(int);
};
B b(42L); // now calls B(int), used to call B<long>(long),
// which called A<int> due to substitution failure
// in A<long>(long).
```

C.4.6 Clause 13: templates [diff.cpp14.temp]

1 Affected subclause: 13.10.3.6
Change: Allowance to deduce from the type of a non-type template argument.
Rationale: In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. For example:

```cpp
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
    foo(p); // ill-formed; previously well-formed
}
```

C.4.7 Clause 14: exception handling [diff.cpp14.except]

1 Affected subclause: 14.5
Change: Remove dynamic exception specifications.
Rationale: Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.
Effect on original feature: A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls terminate rather than unexpected, and it is unspecified whether stack unwinding is performed prior to such a call.

C.4.8 Clause 16: library introduction [diff.cpp14.library]

1 Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: <any> (22.7.2), <charconv> (22.13.1), <execution> (22.12.2), <filesystem> (31.12.4), <memory_resource> (20.4.1), <optional> (22.5.2), <string_view> (23.3.2), and <variant> (22.6.2). Valid C++ 2014 code that #includes headers with these names may be invalid in this revision of C++.

2 Affected subclause: 16.4.5.2.3
Change: New reserved namespaces.
Rationale: Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.
Effect on original feature: The global namespaces std followed by an arbitrary sequence of digits (5.10) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., std2, may be invalid in this revision of C++.
C.4.9 Clause 22: general utilities library

1 Affected subclause: 22.10.17
Change: Constructors taking allocators removed.
Rationale: No implementation consensus.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.

2 Affected subclause: 20.3.2.2
Change: Different constraint on conversions from `unique_ptr`.
Rationale: Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:
```cpp
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

C.4.10 Clause 23: strings library

23.4.3

1 Affected subclause: 23.4.3
Change: Non-const `.data()` member added.
Rationale: The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.
Effect on original feature: Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string’s `.data()` member in this revision of C++. For example:
```cpp
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed
```

C.4.11 Clause 24: containers library

24.2.7

1 Affected subclause: 24.2.7
Change: Requirements change.
Rationale: Increase portability, clarification of associative container requirements.
Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++. For example:
```cpp
#include <set>
struct compare
{
    bool operator()(int a, int b)
    {
        return a < b;
    }
};

int main()
{
    const std::set<int, compare> s;
    s.find(0);
}
```

C.4.12 Annex D: compatibility features

1963

1 Change: The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.
Rationale: Superseded by new features.
Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.
Change: Remove old iostreams members [depr.ios.members].

Rationale: Redundant feature for compatibility with pre-standard code has served its time.

Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

C.5 C++ and ISO C++ 2011 [diff.cpp11]

C.5.1 General [diff.cpp11.general]

Subclause C.5 lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.5.2 Clause 5: lexical conventions [diff.cpp11.lex]

Affected subclause: 5.9

Change: `pp-number` can contain one or more single quotes.

Rationale: Necessary to enable single quotes as digit separators.

Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a character-literal in C++ 2011, whereas they are digit separators in this revision of C++. For example:

```cpp
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2, 3'4, 5) };
// int x[2] = { 5 };
// C++ 2011
// int x[2] = { 3'4, 5 };
// this revision of C++
```

C.5.3 Clause 6: basics [diff.cpp11.basic]

Affected subclause: 6.7.5.5.3

Change: New usual (non-placement) deallocator.

Rationale: Required for sized deallocation.

Effect on original feature: Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```cpp
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` might match a predefined usual (non-placement) `operator delete` (6.7.5.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).

C.5.4 Clause 7: expressions [diff.cpp11.expr]

Affected subclause: 7.6.16

Change: A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.

Rationale: Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.

Effect on original feature: Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++. For example:

```cpp
struct S {
    int x = 1;
    void mf() { x = 2; }
};
int f(bool cond) {
    S s;
    (cond ? s : throw 0).mf();
    return s.x;
}
```

In C++ 2011, `f(true)` returns 1. In this revision of C++, it returns 2.

```cpp
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`. 

§ C.5.4
C.5.5 Clause 9: declarations

Affected subclause: 9.2.6
Change: constexpr non-static member functions are not implicitly const member functions.
Rationale: Necessary to allow constexpr member functions to mutate the object.
Effect on original feature: Valid C++ 2011 code may fail to compile in this revision of C++. For example:

```cpp
struct S {
    constexpr const int &f();
    int &f();
};
```

This code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types.

C.5.6 Clause 16: library introduction

Affected subclause: 16.4.2.3
Change: New header.
Rationale: New functionality.
Effect on original feature: The C++ header `<shared_mutex>` (33.6.3) is new. Valid C++ 2011 code that 
#include s a header with that name may be invalid in this revision of C++.

C.5.7 Clause 31: input/output library

Affected subclause: 31.13
Change: gets is not defined.
Rationale: Use of gets is considered dangerous.
Effect on original feature: Valid C++ 2011 code that uses the gets function may fail to compile in this revision of C++.

C.6 C++ and ISO C++ 2003

C.6.1 General

Subclause C.6 lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.6.2 Clause 5: lexical conventions

Affected subclause: 5.4
Change: New kinds of string-literals.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a string-literal but will be interpreted as part of the string-literal. For example:

```cpp
#define u8 "abc"
const char* s = u8"def";  // Previously "abcdef", now "def"
```
Affected subclause: 5.4
Change: User-defined literal string support.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
#define _x "there"
"hello"_x  // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro _x would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded.

Affected subclause: 5.11
Change: New keywords.
Rationale: Required for new features.
Effect on original feature: Added to Table 5, the following identifiers are new keywords: alignas, alignof, char16_t, char32_t, constexpr, decltype, noexcept, nullptr, static_assert, and thread_local. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.

Affected subclause: 5.13.2
Change: Type of integer literals.
Rationale: C99 compatibility.
Effect on original feature: Certain integer literals larger than can be represented by long could change from an unsigned integer type to signed long long.

Affected subclause: 7.3.12
Change: Only literals are integer null pointer constants.
Rationale: Removing surprising interactions with templates and constant expressions.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
void f(void *);  // #1
void f(...);    // #2
template<int N> void g() {
    f(0*N);   // calls #2; used to call #1
}
```

Affected subclause: 7.6.5
Change: Specify rounding for results of integer / and %.
Rationale: Increase portability, C99 compatibility.
Effect on original feature: Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.

Affected subclause: 7.6.14
Change: && is valid in a type-name.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
bool b1 = new int && false;     // previously false, now ill-formed
struct S { operator int(); };  
bool b2 = &S::operator int && false;  // previously false, now ill-formed
```

Affected subclause: 9.2
Change: Remove auto as a storage class specifier.
Rationale: New feature.
Effect on original feature: Valid C++ 2003 code that uses the keyword auto as a storage class specifier may be invalid in this revision of C++. In this revision of C++, auto indicates that the type of a variable is to be deduced from its initializer expression.

Affected subclause: 9.4.5
Change: Narrowing restrictions in aggregate initializers.
Rationale: Catches bugs.
Effect on original feature: Valid C++ 2003 code may fail to compile in this revision of C++. For example:

```c++
int x[] = { 2.0 };
```

This code is valid in C++ 2003 but invalid in this revision of C++ because `double` to `int` is a narrowing conversion.

C.6.5 Clause 11: classes

1 Affected subclauses: 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6

Change: Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.

Rationale: Improves template argument deduction failure.

Effect on original feature: A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

2 Affected subclause: 11.4.7

Change: User-declared destructors have an implicit exception specification.

Rationale: Clarification of destructor requirements.

Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call `std::terminate` (without calling `std::unexpected`) if their exception specification is non-throwing.

C.6.6 Clause 13: templates

1 Affected subclause: 13.2

Change: Repurpose `export` for modules (Clause 10, 15.4, 15.5).

Rationale: No implementation consensus for the C++ 2003 meaning of `export`.

Effect on original feature: A valid C++ 2003 program containing `export` is ill-formed in this revision of C++.

2 Affected subclause: 13.4

Change: Remove whitespace requirement for nested closing template right angle brackets.

Rationale: Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.

Effect on original feature: Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates. For example:

```c++
template <class T> struct X { };  // invalid in this revision of C++
template <int N> struct Y { };    // invalid in this revision of C++
x Y< 1 >> 2 >> x;                // closes two templates.
```

3 Affected subclause: 13.8.4.2

Change: Allow dependent calls of functions with internal linkage.

Rationale: Overly constrained, simplify overload resolution rules.

Effect on original feature: A valid C++ 2003 program can get a different result in this revision of C++.

C.6.7 Clause 16: library introduction

1 Affected: Clause 16 – Clause 33

Change: New reserved identifiers.

Rationale: Required by new features.

Effect on original feature: Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.

2 Affected subclause: 16.4.2.3

Change: New headers.

Rationale: New functionality.

Effect on original feature: The following C++ headers are new: `<array>` (24.3.2), `<atomic>` (33.5.2),
<chrono> (29.2), <codecvt> (D.26.2), <condition_variable> (33.7.2), <forward_list> (24.3.4), <future> (33.10.2), <initializer_list> (17.10.2), <mutex> (33.6.2), <random> (28.5.2), <ratio> (21.4.2), <regex> (32.3), <scoped_allocator> (20.5.1), <system_error> (19.5.2), <thread> (33.4.2), <tuple> (22.4.2), <typeindex> (22.11.1), <type_traits> (21.3.3), <unordered_map> (24.5.2), and <unordered_set> (24.5.3). In addition the following C compatibility headers are new: <cfenv> (28.3.1), <cinttypes> (31.13.2), <cstdint> (17.4.1), and <cuchar> (23.5.5). Valid C++ 2003 code that #includes headers with these names may be invalid in this revision of C++.

3 Affected subclause: 16.4.4.3
Effect on original feature: Function swap moved to a different header
Rationale: Remove dependency on <algorithm> (27.4) for swap.
Effect on original feature: Valid C++ 2003 code that has been compiled expecting swap to be in <algorithm> (27.4) may have to instead include <utility> (22.2.1).

4 Affected subclause: 16.4.5.2.2
Change: New reserved namespace.
Rationale: New functionality.
Effect on original feature: The global namespace posix is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace posix may be invalid in this revision of C++.

5 Affected subclause: 16.4.6.3
Change: Additional restrictions on macro names.
Rationale: Avoid hard to diagnose or non-portable constructs.
Effect on original feature: Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines override, final, carries_dependency, or noreturn as macros is invalid in this revision of C++.

C.6.8 Clause 17: language support library [diff.cpp03.language.support]
1 Affected subclause: 17.6.3.2
Change: operator new may throw exceptions other than std::bad_alloc.
Rationale: Consistent application of noexcept.
Effect on original feature: Valid C++ 2003 code that assumes that global operator new only throws std::bad_alloc may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable operator new is ill-formed in this revision of C++, because the exception specification of throw(std::bad_alloc) was removed.

C.6.9 Clause 19: diagnostics library [diff.cpp03.diagnostics]
1 Affected subclause: 19.4
Change: Thread-local error numbers.
Rationale: Support for new thread facilities.
Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on errno being the same across threads may change behavior in this revision of C++.

C.6.10 Clause 22: general utilities library [diff.cpp03.utilities]
1 Affected subclauses: 22.10.6, 22.10.7, 22.10.8, 22.10.10, and 22.10.11
Change: Standard function object types no longer derived from std::unary_function or std::binary_function.
Rationale: Superseded by new feature; unary_function and binary_function are no longer defined.
Effect on original feature: Valid C++ 2003 code that depends on function object types being derived from unary_function or binary_function may fail to compile in this revision of C++.

C.6.11 Clause 23: strings library [diff.cpp03.strings]
1 Affected subclause: 23.4
Change: basic_string requirements no longer allow reference-counted strings.
Rationale: Invalidation is subtly different with reference-counted strings. This change regularizes behavior.
Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++.

2 Affected subclause: 23.4.3.2
Change: Loosen basic_string invalidation rules.
Rationale: Allow small-string optimization.
**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. Some const member functions, such as data and c_str, no longer invalidate iterators.

### C.6.12 Clause 24: containers library

1. **Affected subclause:** 24.2  
   **Change:** Complexity of size() member functions now constant.  
   **Rationale:** Lack of specification of complexity of size() resulted in divergent implementations with inconsistent performance characteristics.  
   **Effect on original feature:** Some container implementations that conform to C++ 2003 may not conform to the specified size() requirements in this revision of C++. Adjusting containers such as std::list to the stricter requirements may require incompatible changes.

2. **Affected subclause:** 24.2  
   **Change:** Requirements change: relaxation.  
   **Rationale:** Clarification.  
   **Effect on original feature:** Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:
   - not all containers provide size(); use empty() instead of size() == 0;
   - not all containers are empty after construction (array);
   - not all containers have constant complexity for swap() (array).

3. **Affected subclause:** 24.2  
   **Change:** Requirements change: default constructible.  
   **Rationale:** Clarification of container requirements.  
   **Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

4. **Affected subclauses:** 24.2.4 and 24.2.7  
   **Change:** Signature changes: from void return types.  
   **Rationale:** Old signature threw away useful information that may be expensive to recalculate.  
   **Effect on original feature:** The following member functions have changed:
   - erase(iter) for set, multiset, map, multimap
   - erase(begin, end) for set, multiset, map, multimap
   - insert(pos, num, val) for vector, deque, list, forward_list
   - insert(pos, beg, end) for vector, deque, list, forward_list

   Valid C++ 2003 code that relies on these functions returning void (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

5. **Affected subclauses:** 24.2.4 and 24.2.7  
   **Change:** Signature changes: from iterator to const_iterator parameters.  
   **Rationale:** Overspecification.  
   **Effect on original feature:** The signatures of the following member functions changed from taking an iterator to taking a const_iterator:
   - insert(iter, val) for vector, deque, list, set, multiset, map, multimap
   - insert(pos, beg, end) for vector, deque, list, forward_list
   - erase(begin, end) for set, multiset, map, multimap
   - all forms of list::splice
   - all forms of list::merge

   Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

6. **Affected subclauses:** 24.2.4 and 24.2.7  
   **Change:** Signature changes: resize.  
   **Rationale:** Performance, compatibility with move semantics.  
   **Effect on original feature:** For vector, deque, and list the fill value passed to resize is now passed by reference instead of by value, and an additional overload of resize has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.
C.6.13 Clause 27: algorithms library

Affected subclause: 27.1
Change: Result state of inputs after application of some algorithms.
Rationale: Required by new feature.
Effect on original feature: A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, std::remove and std::remove_if may leave the tail of the input sequence with a different set of values than previously.

C.6.14 Clause 28: numerics library

Affected subclause: 28.4
Change: Specified representation of complex numbers.
Rationale: Compatibility with C99.
Effect on original feature: Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of std::complex may not be compatible with this revision of C++.

C.6.15 Clause 30: localization library

Affected subclause: 30.4.3.2.3
Change: The num_get facet recognizes hexadecimal floating point values.
Rationale: Required by new feature.
Effect on original feature: Valid C++ 2003 code may have different behavior in this revision of C++.

C.6.16 Clause 31: input/output library

Affected subclauses: 31.7.5.2.4, 31.7.6.2.4, and 31.5.4.4
Change: Specify use of explicit in existing boolean conversion functions.
Rationale: Clarify intentions, avoid workarounds.
Effect on original feature: Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

1. passing a value to a function that takes an argument of type bool;
2. using operator== to compare to false or true;
3. returning a value from a function with a return type of bool;
4. initializing members of type bool via aggregate initialization;
5. initializing a const bool& which would bind to a temporary object.

Affected subclause: 31.5.2.2.1
Change: Change base class of std::ios_base::failure.
Rationale: More detailed error messages.
Effect on original feature: std::ios_base::failure is no longer derived directly from std::exception, but is now derived from std::system_error, which in turn is derived from std::runtime_error. Valid C++ 2003 code that assumes that std::ios_base::failure is derived directly from std::exception may execute differently in this revision of C++.

Affected subclause: 31.5.2
Change: Flag types in std::ios_base are now bitmasks with values defined as constexpr static members.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code that relies on std::ios_base flag types being represented as std::bitset or as an integer type may fail to compile with this revision of C++. For example:

```cpp
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag);  // error: setf does not take argument of type int
}
```
C.7  C++ and ISO C  [diff.iso]

C.7.1  General  [diff.iso.general]

Subclause C.7 lists the differences between C++ and ISO C, in addition to those listed above, by the chapters of this document.

C.7.2  Clause 5: lexical conventions  [diff.lex]

Affected subclause: 5.11
Change: New Keywords
New keywords are added to C++; see 5.11.
Rationale: These keywords were added in order to implement the new semantics of C++.
Effect on original feature: Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.
Difficulty of converting: Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.
How widely used: Common.

2 Affected subclause: 5.13.3
Change: Type of character-literal is changed from int to char.
Rationale: This is needed for improved overloaded function argument type matching. For example:

```
int function( int i );
int function( char c );
```

function( 'x' );

It is preferable that this call match the second version of function rather than the first.
Effect on original feature: Change to semantics of well-defined feature. ISO C programs which depend on
```
sizeof('x') == sizeof(int)
```

will not work the same as C++ programs.
Difficulty of converting: Simple.
How widely used: Programs which depend upon sizeof('x') are probably rare.

3 Affected subclause: 5.13.5
Change: Concatenated string-literals can no longer have conflicting encoding-prefixes.
Rationale: Removal of non-portable feature.
Effect on original feature: Concatenation of string-literals with different encoding-prefixes is now ill-formed.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

4 Affected subclause: 5.13.5
Change: String literals made const.
The type of a string-literal is changed from “array of char” to “array of const char”. The type of a UTF-8 string literal is changed from “array of char” to “array of const char8_t”. The type of a UTF-16 string literal is changed from “array of some-integer-type” to “array of const char16_t”. The type of a UTF-32 string literal is changed from “array of some-integer-type” to “array of const char32_t”. The type of a wide string literal is changed from “array of wchar_t” to “array of const wchar_t”.
Rationale: This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Syntactic transformation. The fix is to add a cast:
```
char* p = "abc";  // valid in C, invalid in C++
void f(char*) {
    char* p = (char*)"abc";  // OK, cast added
    f(p);
    f((char*)"def");  // OK, cast added
}
```

How widely used: Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.
C.7.3 Clause 6: basics

1 Affected subclause: 6.2
Change: C++ does not have “tentative definitions” as in C.
E.g., at file scope,

```c
int i;
int i;
```
is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C. For example,

```c
struct X { int i; struct X* next; };
static struct X a;
static struct X b = { 0, &a };  
static struct X a = { 1, &b };
```

Rationale: This avoids having different initialization rules for fundamental types and user-defined types.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

How widely used: Seldom.

2 Affected subclause: 6.4
Change: A struct is a scope in C++, not in C. For example,

```c
struct X {
    struct Y { int a; } b;
}
struct Y c;
```
is valid in C but not in C++, which would require X::Y c;

Rationale: Class scope is crucial to C++, and a struct is a class.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: C programs use struct extremely frequently, but the change is only noticeable when struct, enumeration, or enumerator names are referred to outside the struct. The latter is probably rare.

3 Affected subclause: 6.6 [also 9.2.9]
Change: A name of file scope that is explicitly declared const, and not explicitly declared extern, has internal linkage, while in C it would have external linkage.

Rationale: Because const objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each const object. This feature allows the user to put const objects in source files that are included in more than one translation unit.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

4 Affected subclause: 6.9.3.1
Change: The main function cannot be called recursively and cannot have its address taken.

Rationale: The main function may require special actions.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Trivial: create an intermediary function such as mymain(argc, argv).

How widely used: Seldom.

5 Affected subclause: 6.8
Change: C allows “compatible types” in several places, C++ does not.
For example, otherwise-identical struct types with different tag names are “compatible” in C but are distinctly different types in C++.

Rationale: Stricter type checking is essential for C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.

How widely used: Common.
C.7.4 Clause 7: expressions

1 Affected subclause: 7.3.12
Change: Converting void* to a pointer-to-object type requires casting.

```c
char a[10];
void* b=a;
void foo() {
    char* c=b;
}
```

ISO C accepts this usage of pointer to void being assigned to a pointer to object type. C++ does not.

Rationale: C++ tries harder than C to enforce compile-time type safety.

Difficulty of converting: Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```c
char* c = (char*) b;
```

How widely used: This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

2 Affected subclauses: 7.6.1.6 and 7.6.2.3
Change: Decrement operator is not allowed with bool operand.

Rationale: Feature with surprising semantics.

Effect on original feature: A valid ISO C expression utilizing the decrement operator on a bool lvalue (for instance, via the C typedef in <stdbool.h> (17.14.5)) is ill-formed in C++.

3 Affected subclauses: 7.6.2.5 and 7.6.3
Change: In C++, types can only be defined in declarations, not in expressions. In C, a sizeof expression or cast expression may define a new type. For example,

```c
p = (void*)(struct x {int i;} *)0;
```

defines a new type, struct x.

Rationale: This prohibition helps to clarify the location of definitions in the source code.

Difficulty of converting: Deletion of semantically well-defined feature.

How widely used: Seldom.

4 Affected subclauses: 7.6.16, 7.6.19, and 7.6.20
Change: The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

Rationale: C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

Effect on original feature: Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```c
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and sizeof(char*) in C.

Difficulty of converting: Programs must add explicit casts to the appropriate rvalue.

How widely used: Rare.

C.7.5 Clause 8: statements

1 Affected subclauses: 8.5.3 and 8.7.6
Change: It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

Rationale: Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, many operations on such an uninitialized object have undefined behavior. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

Affected subclause: 8.7.4
Change: It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.
Rationale: The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between functions with void and int return types.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. Add an appropriate return value to the source code, such as zero.
How widely used: Seldom. For several years, many existing C implementations have produced warnings in this case.

C.7.6 Clause 9: declarations [diff.dcl]

Affected subclause: 9.2.2
Change: In C++, the static or extern specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.
Example:
```c
static struct S {
    int i;
};
```
Rationale: Storage class specifiers don’t have any meaning when associated with a type. In C++, class members can be declared with the static storage class specifier. Storage class specifiers on type declarations can be confusing for users.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

Affected subclause: 9.2.2
Change: In C++, register is not a storage class specifier.
Rationale: The storage class specifier had no effect in C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Common.

Affected subclause: 9.2.4
Change: A C++ typedef-name must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a typedef-name and a struct tag name declared in the same scope can have the same name (because they have different name spaces).
Example:
```c
typedef struct name1 { /* ... */ } name1; // valid C and C++
struct name1 { /* ... */ }; // valid C, invalid C++
typedef int name; // valid C, invalid C++
```
Rationale: For ease of use, C++ doesn’t require that a type name be prefixed with the keywords class, struct or union when used in object declarations or type casts.
Example:
```c
class name { /* ... */ }; // i has type class name
```
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.
How widely used: Seldom.
4 Affected subclause: 9.2.9 [see also 6.6]
Change: Const objects must be initialized in C++ but can be left uninitialized in C.
Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

5 Affected subclause: 9.2.9.6
Change: The keyword auto cannot be used as a storage class specifier.
Example:
```c
void f() {
    auto int x;  // valid C, invalid C++
}
```
Rationale: Allowing the use of auto to deduce the type of a variable from its initializer results in undesired interpretations of auto as a storage class specifier in certain contexts.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Rare.

6 Affected subclause: 9.3.4.6
Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.
Example:
```c
int f();  // means int f(void) in C++
// int f(unknown) in C
```
Rationale: This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).
Effect on original feature: Change to semantics of well-defined feature. This feature was marked as “obsolete” in C.
Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.
How widely used: Common.

7 Affected subclause: 9.3.4.6 [see 7.6.2.5]
Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.
Example:
```c
void f( struct S { int a; } arg );
enum E { A, B, C } f() {}  // valid C, invalid C++
```
Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.
How widely used: Seldom. This style of type definition is seen as poor coding style.

8 Affected subclause: 9.5
Change: In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolete”.
Rationale: Prototypes are essential to type safety.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Common in old programs, but already known to be obsolete.

9 Affected subclause: 9.4.2
Change: In C++, designated initialization support is restricted compared to the corresponding functionality
in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:
```
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2};  // valid C, invalid C++
struct B b = {.a.x = 0};       // valid C, invalid C++
struct A c = {.x = 1, 2};      // valid C, invalid C++
```

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so field initializers must be specified in order. Array designators conflict with lambda-expression syntax. Nested designators are seldom used.

Effect on original feature: Deletion of feature that is incompatible with C++.

Difficulty of converting: Syntactic transformation.

How widely used: Out-of-order initializers are common. The other features are seldom used.

Affected subclause: 9.4.3

Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating '\0') must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating '\0'.

Example:
```
char array[4] = "abcd";      // valid C, invalid C++
```

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string terminating '\0'.

How widely used: Seldom. This style of array initialization is seen as poor coding style.

Affected subclause: 9.7.1

Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:
```
enum color { red, blue, green };
enum color c = 1;        // valid C, invalid C++
```

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

How widely used: Common.

Affected subclause: 9.7.1

Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is int.

Example:
```
enum e { A };
sizeof(A) == sizeof(int)    // in C
sizeof(A) == sizeof(e)     // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

Rationale: In C++, an enumeration is a distinct type.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

Affected subclause: 9.12.2

Change: In C++, an alignment-specifier is an attribute-specifier. In C, an alignment-specifier is a declaration-specifier.
Example:

```c
#include <stdalign.h>
unsigned alignas(8) int x;  // valid C, invalid C++
unsigned int y alignas(8);  // valid C++, invalid C
```

**Rationale:** C++ requires unambiguous placement of the alignment-specifier.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

### C.7.7 Clause 11: classes

1. **Affected subclause:** 11.3 [see also 9.2.4]

   **Change:** In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

   **Example:**
   ```c
   int x[99];
   void f() {
       struct x { int a; };
       sizeof(x);  /* size of the array in C */
       /* size of the struct in C++ */
   }
   ```

   **Rationale:** This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incomaptibility with C described above.

   **Effect on original feature:** Change to semantics of well-defined feature.

   **Difficulty of converting:** Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

   **How widely used:** Seldom.

2. **Affected subclause:** 11.4.5.3

   **Change:** Copying volatile objects.

   The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:

   ```c
   struct X { int i; };
   volatile struct X x1 = {0};
   struct X x2 = x1;  // invalid C++
   struct X x3;
   x3 = x1;  // also invalid C++
   ```

   **Rationale:** Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

   **Effect on original feature:** Deletion of semantically well-defined feature.

   **Difficulty of converting:** Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.

   **How widely used:** Seldom.

3. **Affected subclause:** 11.4.10

   **Change:** Bit-fields of type `plain int` are signed.

   **Rationale:** The signedness needs to be consistent among template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.
Effect on original feature: The choice is implementation-defined in C, but not so in C++.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

Affected subclause: 11.4.12
Change: In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

Example:
```c
struct X {
    struct Y { /* ... */ } y;
};
struct Y yy; // valid C, invalid C++
```

Rationale: C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing struct is defined. Example:
```c
struct Y;
struct X { // struct Y and struct X are at the same scope
    struct Y { /* ... */ } y;
};
```

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in 6.4.

How widely used: Seldom.

Affected subclause: 6.5.2
Change: In C++, a typedef-name may not be redeclared in a class definition after being used in that definition.

Example:
```c
typedef int I;
struct S {
    I i;
    int I; // valid C, invalid C++
};
```

Rationale: When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of I really is.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Either the type or the struct member has to be renamed.

How widely used: Seldom.

C.7.8 Clause 15: preprocessing directives

Affected subclause: 15.11
Change: Whether __STDC__ is defined and if so, what its value is, are implementation-defined.

Rationale: C++ is not identical to ISO C. Mandating that __STDC__ be defined would require that translators make an incorrect claim.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Programs and headers that reference __STDC__ are quite common.
C.8 C standard library

C.8.1 General

Subclause C.8 summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

C.8.2 Modifications to headers

For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in 17.14.

There are no C++ headers for the C standard library’s headers <stdnoreturn.h> and <threads.h>, nor are these headers from the C standard library headers themselves part of C++.

The C headers <complex.h> and <tgmath.h> do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.8.3 Modifications to definitions

C.8.3.1 Types char16_t and char32_t

The types char16_t and char32_t are distinct types rather than typedefs to existing integral types. The tokens char16_t and char32_t are keywords in C++ (5.11). They do not appear as macro or type names defined in <cuchar> (23.5.5).

C.8.3.2 Type wchar_t

The type wchar_t is a distinct type rather than a typedef to an existing integral type. The token wchar_t is a keyword in C++ (5.11). It does not appear as a macro or type name defined in any of <cassert> (19.3.2), <cstdint> (17.2.1), or <cwchar> (23.5.4).

C.8.3.3 Header <assert.h>

The token static_assert is a keyword in C++. It does not appear as a macro name defined in <cassert> (19.3.2).

C.8.3.4 Header <iso646.h>

The tokens and, and_eq, bitand, bitor, compl, not, not_eq, or, or_eq, xor, and xor_eq are keywords in C++ (5.11), and are not introduced as macros by <iso646.h> (17.14.3).

C.8.3.5 Header <stdalign.h>

The token alignas is a keyword in C++ (5.11), and is not introduced as a macro by <stdalign.h> (17.14.4).

C.8.3.6 Header <stdbool.h>

The tokens bool, true, and false are keywords in C++ (5.11), and are not introduced as macros by <stdbool.h> (17.14.5).

C.8.3.7 Macro NULL

The macro NULL, defined in any of <locale> (30.5.1), <cstdint> (17.2.1), <cstring> (31.13.1), <cstdlib> (17.2.2), <cstring> (23.5.3), <ctime> (29.15), or <cwchar> (23.5.4), is an implementation-defined null pointer constant in C++ (17.2).

C.8.4 Modifications to declarations

Header <cstring> (23.5.3): The following functions have different declarations:

- strchr
- strpbrk
- strrchr
- strstr
- memchr
Subclause 23.5.3 describes the changes.

2 Header `<cwchar>` (23.5.4): The following functions have different declarations:

1. `wcschr`
2. `wcspbrk`
3. `wcsrchr`
4. `wcsstr`
5. `wmemchr`

Subclause 23.5.4 describes the changes.

3 Header `<cstddef>` (17.2.1) declares the names `nullptr_t`, `byte`, and `to_integer`, and the operators and operator templates in (17.2.5), in addition to the names declared in `<stddef.h>` (17.14) in the C standard library.

C.8.5 Modifications to behavior [diff.mods.to.behavior]

C.8.5.1 General [diff.mods.to.behavior.general]

1 Header `<stdlib>` (17.2.2): The following functions have different behavior:

1. `atexit`
2. `exit`
3. `abort`

Subclause 17.5 describes the changes.

2 Header `<csetjmp>` (17.13.3): The following functions have different behavior:

1. `longjmp`

Subclause 17.13.3 describes the changes.

C.8.5.2 Macro `offsetof(type, member-designator)` [diff.offsetof]

1 The macro `offsetof`, defined in `<cstddef>` (17.2.1), accepts a restricted set of `type` arguments in C++. Subclause 17.2.4 describes the change.

C.8.5.3 Memory allocation functions [diff.malloc]

1 The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.12 describes the changes.
Annex D  (normative)
Compatibility features

D.1  General

This Annex describes features of the C++ Standard that are specified for compatibility with existing implementations.

These are deprecated features, where deprecated is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the deprecated attribute (9.12.5).

D.2  Arithmetic conversion on enumerations

The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated.

Example 1:
```cpp
def mum E1 { e }
enum E2 { f }
bool b = e <= 3.7;  // deprecated
int k = f - e;      // deprecated
auto cmp = e <=> f; // error
```

D.3  Implicit capture of *this by reference

For compatibility with prior revisions of C++, a lambda-expression with capture-default = (7.5.5.3) may implicitly capture *this by reference.

Example 1:
```cpp
struct X {
  int x;
  void foo(int n) {
    auto f = [=]() { x = n; };  // deprecated: x means this->x, not a copy thereof
    auto g = [=, this]() { x = n; }; // recommended replacement
  }
};
```

D.4  Array comparisons

Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated.

Example 1:
```cpp
int arr1[5];
int arr2[5];
bool same = arr1 == arr2;    // deprecated, same as &arr1[0] == &arr2[0],
// does not compare array contents
auto cmp = arr1 <=> arr2;    // error
```

D.5  Deprecated volatile types

Postfix ++ and -- expressions (7.6.1.6) and prefix ++ and -- expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

Example 1:
```cpp
```
volatile int velociraptor;
++velociraptor;   // deprecated
— end example]

Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example 2:
    int neck, tail;
    volatile int brachiosaur;
    brachiosaur = neck;   // OK
    tail = brachiosaur;   // OK
    tail = brachiosaur = neck;   // deprecated
    brachiosaur += neck;   // OK
— end example]

A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example 3:
    volatile struct amber jurassic();   // deprecated
    void trex(volatile short left_arm, volatile short right_arm);   // deprecated
    void fly(volatile struct pterosaur* pteranodon);   // OK
— end example]

A structured binding (9.6) of a volatile-qualified type is deprecated.

[Example 4:
    struct linhenykus { short forelimb; };
    void park(linhenykus alvarezzauroid) {
        volatile auto [what_is_this] = alvarezzauroid;   // deprecated
        // ...
    }
— end example]

D.6 Redeclaration of static constexpr data members [depr.static.constexpr]

For compatibility with prior revisions of C++, a constexpr static data member may be redundantly redeclared outside the class with no initializer (6.2, 11.4.9.3). This usage is deprecated.

[Example 1:
    struct A {
        static constexpr int n = 5;   // definition (declaration in C++ 2014)
    };
    constexpr int A::n;   // redundant declaration (definition in C++ 2014)
— end example]

D.7 Non-local use of TU-local entities [depr.local]

A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

[Note 1: Such a declaration in an importable module unit is ill-formed. — end note]

[Example 1:
    namespace {
        struct A {
            void f() {}
        };
    }
    A h();   // deprecated: not internal linkage
    inline void g() {A().f();}   // deprecated: inline and not internal linkage
— end example]
D.8 Implicit declaration of copy functions

The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.5.3).

D.9 Literal operator function declarations using an identifier

A literal-operator-id (12.6) of the form

\texttt{operator \textit{string-literal} identifier}

is deprecated.

D.10 template keyword before qualified names

The use of the keyword template before the qualified name of a class or alias template without a template argument list is deprecated (13.3).

D.11 has_denorm members in numeric_limits

The following type is defined in addition to those specified in \texttt{<limits>} (17.3.3):

\begin{verbatim}
namespace std {
    enum float_denorm_style {
        denorm_indeterminate = -1,
        denorm_absent = 0,
        denorm_present = 1
    };
}
\end{verbatim}

The following members are defined in addition to those specified in 17.3.5.1:

\begin{verbatim}
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
\end{verbatim}

The values of \texttt{has_denorm} and \texttt{has_denorm_loss} of specializations of \texttt{numeric_limits} are unspecified.

The following members of the specialization \texttt{numeric_limits<bool>} are defined in addition to those specified in 17.3.5.3:

\begin{verbatim}
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
\end{verbatim}

D.12 Deprecated C macros

The header \texttt{<stdalign.h>} has the following macro:

\texttt{#define \_\_alignas_is_defined 1}

The header \texttt{<stdbool.h>} has the following macro:

\texttt{#define \_\_bool_true_false_are_defined 1}

D.13 Relational operators

The header \texttt{<utility>} (22.2.1) has the following additions:

\begin{verbatim}
namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator> (const T&, const T&);
    template<class T> bool operator<=(const T&, const T&);
    template<class T> bool operator>=(const T&, const T&);
}
\end{verbatim}

To avoid redundant definitions of \texttt{operator!=} out of \texttt{operator==} and operators \texttt{>, <=, and >=} out of \texttt{operator<}, the library provides the following:

\begin{verbatim}
template<class T> bool operator!=(const T& x, const T& y);
\end{verbatim}

Preconditions: \texttt{T meets the Cpp17EqualityComparable requirements (Table 28)}.

Returns: \texttt{!(x == y)}. 

§ D.13
template<class T> bool operator>(const T& x, const T& y);

Preconditions: T meets the Cpp17LessThanComparable requirements (Table 29).
Returns: y < x.

template<class T> bool operator<=(const T& x, const T& y);

Preconditions: T meets the Cpp17LessThanComparable requirements (Table 29).
Returns: !(y < x).

template<class T> bool operator>=(const T& x, const T& y);

Preconditions: T meets the Cpp17LessThanComparable requirements (Table 29).
Returns: !(x < y).

D.14 char* streams

D.14.1 Header <strstream> synopsis

The header <strstream> defines types that associate stream buffers with character array objects and assist reading and writing such objects.

namespace std {
    class strstreambuf;
    class istrstream;
    class ostrstream;
    class strstream;
}

D.14.2 Class strstreambuf

D.14.2.1 General

namespace std {
    class strstreambuf : public basic_streambuf<char> {
public:
    strstreambuf() : strstreambuf(0) {}
    explicit strstreambuf(streamsize alsize_arg);
    strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
    strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
    strstreambuf(const char* gnext_arg, streamsize n);
    strstreambuf(signed char* gnext_arg, streamsize n,
        signed char* pbeg_arg = nullptr);
    strstreambuf(const signed char* gnext_arg, streamsize n);
    strstreambuf(const unsigned char* gnext_arg, streamsize n,
        unsigned char* pbeg_arg = nullptr);
    strstreambuf(const unsigned char* gnext_arg, streamsize n);
    virtual ~strstreambuf();

    void freeze(bool freezefl = true);
    char* str();
    int pcount();

protected:
    int_type overflow (int_type c = EOF) override;
    int_type pbackfail(int_type c = EOF) override;
    int_type underflow() override;
    pos_type seekoff(off_type off, ios_base::seekdir way,
        ios_base::openmode which = ios_base::in | ios_base::out) override;
    pos_type seekpos(pos_type sp,
        ios_base::openmode which = ios_base::in | ios_base::out) override;
    streambuf* setbuf(char* s, streamsize n) override;

private:
    using strstate = T1;  // exposition only
}
The class \texttt{strstreambuf} associates the input sequence, and possibly the output sequence, with an object of some character array type, whose elements store arbitrary values. The array object has several attributes.

\begin{itemize}
\item allocated, set when a dynamic array object has been allocated, and hence will be freed by the destructor for the \texttt{strstreambuf} object;
\item constant, set when the array object has \texttt{const} elements, so the output sequence cannot be written;
\item dynamic, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;
\item frozen, set when the program has requested that the array object not be altered, reallocated, or freed.
\end{itemize}

\begin{table}[h]
\centering
\caption{\texttt{strstreambuf(streamsize)} effects}
\begin{tabular}{|l|l|}
\hline
Element & Value \\
\hline
\texttt{strmode} & \texttt{dynamic} \\
\texttt{alsize} & \texttt{alsize} \\
\texttt{palloc} & a null pointer \\
\texttt{pfree} & a null pointer \\
\hline
\end{tabular}
\end{table}

Each object of class \texttt{strstreambuf} has a \textit{seekable area}, delimited by the pointers \texttt{seeklow} and \texttt{seekhigh}. If \texttt{gnext} is a null pointer, the seekable area is undefined. Otherwise, \texttt{seeklow} equals \texttt{gbeg} and \texttt{seekhigh} is either \texttt{pend}, if \texttt{pend} is not a null pointer, or \texttt{gend}.

\section*{D.14.2.2 strstreambuf constructors \cite{depr.strstreambuf.cons}}

\begin{verbatim}
explicit strstreambuf(streamsize alsize_arg);
\end{verbatim}

\begin{itemize}
\item Effects: Initializes the base class with \texttt{streambuf()}. The postconditions of this function are indicated in Table 147.
\end{itemize}

\begin{verbatim}
strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
\end{verbatim}

\begin{itemize}
\item Effects: Initializes the base class with \texttt{streambuf()}. The postconditions of this function are indicated in Table 148.
\end{itemize}

\begin{verbatim}
strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
strstreambuf(signed char* gnext_arg, streamsize n, 
            signed char* pbeg_arg = nullptr);
\end{verbatim}

\section*{§ D.14.2.2}

1985
Table 148: `strstreambuf(void* (*)(size_t), void (*)(void*))` effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>strmode</code></td>
<td>dynamic</td>
</tr>
<tr>
<td><code>alsize</code></td>
<td>an unspecified value</td>
</tr>
<tr>
<td><code>palloc</code></td>
<td><code>palloc_arg</code></td>
</tr>
<tr>
<td><code>pfree</code></td>
<td><code>pfree_arg</code></td>
</tr>
</tbody>
</table>

`strstreambuf(unsigned char* gnext_arg, streamsize n,  
unsigned char* pbeg_arg = nullptr);`

**Effects:** Initializes the base class with `streambuf()`. The postconditions of this function are indicated in Table 149.

Table 149: `strstreambuf(charT*, streamsize, charT*)` effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>strmode</code></td>
<td>0</td>
</tr>
<tr>
<td><code>alsize</code></td>
<td>an unspecified value</td>
</tr>
<tr>
<td><code>palloc</code></td>
<td>a null pointer</td>
</tr>
<tr>
<td><code>pfree</code></td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

`gnext_arg` shall point to the first element of an array object whose number of elements N is determined as follows:

- If `n > 0`, N is `n`.
- If `n == 0`, N is `std::strlen(gnext_arg)`.
- If `n < 0`, N is `INT_MAX`.\(^{306}\)

If `pbeg_arg` is a null pointer, the function executes:

```cpp
setg(gnext_arg, gnext_arg, gnext_arg + N);
```

Otherwise, the function executes:

```cpp
setg(gnext_arg, gnext_arg, pbeg_arg);
setp(pbeg_arg, pbeg_arg + N);
```

`strstreambuf(const char* gnext_arg, streamsize n);`  
`strstreambuf(const signed char* gnext_arg, streamsize n);`  
`strstreambuf(const unsigned char* gnext_arg, streamsize n);`

**Effects:** Behaves the same as `strstreambuf((char*)gnext_arg,n)`, except that the constructor also sets constant in `strmode`.

`virtual ~strstreambuf();`

**Effects:** Destroys an object of class `strstreambuf`. The function frees the dynamically allocated array object only if `(strmode & allocated) != 0` and `(strmode & frozen) == 0`. (D.14.2.4 describes how a dynamically allocated array object is freed.)

D.14.2.3 Member functions

```cpp
void freeze(bool freezefl = true);
```

**Effects:** If `strmode & dynamic` is nonzero, alters the freeze status of the dynamic array object as follows:

- If `freezefl` is `true`, the function sets `frozen` in `strmode`.
- Otherwise, it clears `frozen` in `strmode`.

\(^{306}\) The function signature `strlen(const char*)` is declared in `<cstring>` (23.5.3). The macro `INT_MAX` is defined in `<climits>` (17.3.6).

\[\text{§ D.14.2.3}\]
char* str();

Effects: Calls freeze(), then returns the beginning pointer for the input sequence, gbeg.

Remarks: The return value can be a null pointer.

int pcount() const;

Effects: If the next pointer for the output sequence, pnext, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, pnext - pbeg.

D.14.2.4 `strstreambuf` overridden virtual functions

```
int_type overflow(int_type c = EOF) override;
```

Effects: Appends the character designated by c to the output sequence, if possible, in one of two ways:

1. If c != EOF and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns c to *pnext++. Returns (unsigned char)c.
2. If c == EOF, there is no character to append. Returns a value other than EOF.

Remarks: The function can alter the number of write positions available as a result of any call.

To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements \( n \) to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified. If palloc is not a null pointer, the function calls (*palloc)(n) to allocate the new dynamic array object. Otherwise, it evaluates the expression `new charT[n]`. In either case, if the allocation fails, the function returns EOF. Otherwise, it sets `allocated` in strmode.

To free a previously existing dynamic array object whose first element address is p: If pfree is not a null pointer, the function calls (*pfree)(p). Otherwise, it evaluates the expression `delete[]p`.

If (strmode & dynamic) == 0, or if (strmode & frozen) != 0, the function cannot extend the array (reallocating it with greater length) to make a write position available.

Recommended practice: An implementation should consider alsize in making the decision how many additional write positions to make available.

```
int_type pbackfail(int_type c = EOF) override;
```

Puts back the character designated by c to the input sequence, if possible, in one of three ways:

1. If c != EOF, if the input sequence has a putback position available, and if (char)c == gnext[-1], assigns gnext-1 to gnext.
   Returns c.
2. If c != EOF, if the input sequence has a putback position available, and if strmode & constant is zero, assigns c to *--gnext.
   Returns c.
3. If c == EOF and if the input sequence has a putback position available, assigns gnext - 1 to gnext.
   Returns a value other than EOF.

Returns EOF to indicate failure.

Remarks: If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type underflow() override;
```

Effects: Reads a character from the input sequence, if possible, without moving the stream position past it, as follows:
— If the input sequence has a read position available, the function signals success by returning *(unsigned char)*gnext.

— Otherwise, if the current write next pointer pnext is not a null pointer and is greater than the current read end pointer gend, makes a read position available by assigning to gend a value greater than gnext and no greater than pnext.

Returns *(unsigned char)*gnext.

— Otherwise, if the current write next pointer pnext is not a null pointer and is greater than the current read end pointer gend, makes a read position available by assigning to gend a value greater than gnext and no greater than pnext.

Returns *(unsigned char)*gnext.

Remarks: The function can alter the number of read positions available as a result of any call.

pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;

Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 150.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>(which &amp; ios::in) != 0</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td>(which &amp; ios::out) != 0</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>(which &amp; (ios::in</td>
<td>ios::out)) == (ios::in</td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines newoff as indicated in Table 151.

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios::cur</td>
<td>the next pointer minus the beginning pointer (xnext - xbeg).</td>
</tr>
<tr>
<td>way == ios::end</td>
<td>seekhigh minus the beginning pointer (seekhigh - xbeg).</td>
</tr>
</tbody>
</table>

If (newoff + off) < (seeklow - xbeg) or (seekhigh - xbeg) < (newoff + off), the positioning operation fails. Otherwise, the function assigns xbeg + newoff + off to the next pointer xnext.

Returns: pos_type(newoff), constructed from the resultant offset newoff (of type off_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is pos_type(off_type(-1)).

pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;

Effects: Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in sp (as described below).

— If (which & ios::in) != 0, positions the input sequence.
— If (which & ios::out) != 0, positions the output sequence.
— If the function positions neither sequence, the positioning operation fails.

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines newoff from sp.offset():

— If newoff is an invalid stream position, has a negative value, or has a value greater than (seekhigh - seeklow), the positioning operation fails

— Otherwise, the function adds newoff to the beginning pointer xbeg and stores the result in the next pointer xnext.
Returns: \texttt{pos\_type(newoff)}, constructed from the resultant offset \texttt{newoff} (of type \texttt{off\_type}), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is \texttt{pos\_type(\texttt{off\_type(-1)})}.

streambuf<char*> setbuf(char* s, streamsize n) override;

Effects: Behavior is implementation-defined, except that \texttt{setbuf(0,0)} has no effect.

D.14.3 Class istrstream

namespace std {
    class istrstream : public basic_istream<char> {
    public:
        explicit istrstream(const char* s);
        explicit istrstream(char* s);
        istrstream(const char* s, streamsize n);
        istrstream(char* s, streamsize n);
        virtual ~istrstream();

        strstreambuf* rdbuf() const;
        char* str();
    private:
        strstreambuf sb; // exposition only
    };
}

The class istrstream supports the reading of objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

\begin{equation}
(1.1) \quad \text{sb, the strstreambuf object.}
\end{equation}

D.14.3.1 istrstream constructors

explicit istrstream(const char* s);
explicit istrstream(char* s);

Effects: Initializes the base class with istream(&sb) and sb with strstreambuf(s, 0). s shall designate the first element of an NTBS.

istrstream(const char* s, streamsize n);
istrstream(char* s, streamsize n);

Effects: Initializes the base class with istream(&sb) and sb with strstreambuf(s, n). s shall designate the first element of an array whose length is n elements, and n shall be greater than zero.

D.14.3.3 Member functions

strstreambuf* rdbuf() const;

Returns: \texttt{const\_cast<strstreambuf*>(\&sb)}.

char* str();

Returns: \texttt{rdbuf()->str()}. 

D.14.4 Class ostrstream

namespace std {
    class ostrstream : public basic_ostream<char> {
    public:
        ostrstream();
        ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
        virtual ~ostrstream();
    }
}
The class `ostrstream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `strstreambuf` object.

### D.14.4.2 ostrstream constructors

[depr.ostrstream.cons]

```cpp
ostrstream();
```

1 **Effects:** Initializes the base class with `ostream(&sb)` and `sb` with `strstreambuf()`.

```cpp
ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
```

2 **Effects:** Initializes the base class with `ostream(&sb)`, and `sb` with one of two constructors:

(2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements.

The constructor is `strstreambuf(s, n, s)`.

(2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an `NTBS` whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`. 307

### D.14.4.3 Member functions

[depr.ostrstream.members]

```cpp
strstreambuf* rdbuf() const;
```

1 **Returns:** `(strstreambuf*)&sb`.

```cpp
void freeze(bool freezefl = true);
```

2 **Effects:** Calls `rdbuf()->freeze(freezefl)`.

```cpp
char* str();
```

3 **Returns:** `rdbuf()->str()`.

```cpp
int pcount() const;
```

4 **Returns:** `rdbuf()->pcount()`.

### D.14.5 Class strstream

[depr.strstream]

#### D.14.5.1 General

[depr.strstream.general]

```cpp
namespace std {

class strstream {

public: basic_iostream<char> { public:

// types
using char_type = char;
using int_type = char_traits<char>::int_type;
using pos_type = char_traits<char>::pos_type;
using off_type = char_traits<char>::off_type;

// constructors/destructor
strstream();
strstream(char* s, int n,
    ios_base::openmode mode = ios_base::in|ios_base::out);
virtual ~strstream();

}

307) The function signature `strlen(const char*)` is declared in `<cstring>` (23.5.3).
The class `strstream` supports reading and writing from objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

\[(1.1) \quad \text{sb, the strstreambuf object.}\]

### D.14.5.2 `strstream` constructors

#### [depr.strstream.cons]

```cpp
class strstream {  
public:
    strstream(); // Effects: Initializes the base class with `iostream(&sb)`.  
    strstream(char* s, int n, ios_base::openmode mode = ios_base::in|ios_base::out); // Effects: Initializes the base class with `iostream(&sb)`, and `sb` with one of the two constructors:
      
(2.1)  
      - If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements. The constructor is `strstreambuf(s,n,s)`.  
      - If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an `ntbs` whose first element is designated by `s`. The constructor is `strstreambuf(s,n,s + std::strlen(s))`.  

D.14.5.3 `strstream` destructor

#### [depr.strstream.dest]

```cpp
virtual ~strstream(); // Effects: Destroys an object of class `strstream`.  
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```

```
```
```
```
```
The value of each `enum errc` enumerator above is the same as the value of the `<cerrno>` macro shown in the above synopsis.

**D.16 The default allocator**

The following member is defined in addition to those specified in 20.2.10:

```cpp
namespace std {
    template<class T> class allocator {
        public:
            using is_always_equal = true_type;
    }
}
```

**D.17 Deprecated polymorphic_allocator member function**

The following member is declared in addition to those members specified in 20.4.3.3:

```cpp
namespace std::pmr {
    template<class Tp = byte>
    class polymorphic_allocator {
        public:
            template <class T>
            void destroy(T* p);
    }
}
```

```cpp
template<class T>
void destroy(T* p);
```

*Effects*: As if by `p->~T()`.

**D.18 Deprecated type traits**

The header `<type_traits>` (21.3.3) has the following addition:

```cpp
namespace std {
    template<class T> struct is_pod;
    template<class T> constexpr bool is_pod_v = is_pod<T>::value;
    template<size_t Len, size_t Align = default-alignment> struct aligned_storage; // see below
    template<size_t Len, size_t Align = default-alignment> struct aligned_storage_t = typename aligned_storage<Len, Align>::type;
    template<size_t Len, class... Types> struct aligned_union; // see below
    template<size_t Len, class... Types> using aligned_union_t = typename aligned_union<Len, Types...>::type;
}
```

The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

A **POD class** is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A **POD type** is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

```cpp
template<class T> struct is_pod;
```

*Preconditions*: `remove_all_extents_t<T>` shall be a complete type or `cv void`.

*Remarks*: `is_pod<T>` is a `Cpp17UnaryTypeTrait` (21.3.2) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise.

*Note 1*: It is unspecified whether a closure type (7.5.5.2) is a POD type. — end note
template<
size_t Len, size_t Align = default-alignment
>
struct aligned_storage;

The value of default-alignment is the most stringent alignment requirement for any object type whose size is no greater than Len (6.8).

Mandates: Len is not zero. Align is equal to alignof(T) for some type T or to default-alignment.

The member typedef type denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most Len and whose alignment is a divisor of Align.

[Note 2: Uses of aligned_storage<Len, Align>::type can be replaced by an array std::byte[Len] declared with alignas(Align). — end note]

[Note 3: A typical implementation would define aligned_storage as:

template<
size_t Len, size_t Alignment
>
struct aligned_storage {
    typedef struct {
        alignas(Alignment) unsigned char __data[Len];
    } type;
};

— end note]

template<
size_t Len, class... Types>
struct aligned_union;

Mandates: At least one type is provided. Each type in the template parameter pack Types is a complete object type.

The member typedef type denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in Types; its size shall be at least Len. The static member alignment_value is an integral constant of type size_t whose value is the strictest alignment of all types listed in Types.

D.19 Tuple

The header <tuple> (22.4.2) has the following additions:

namespace std {
    template<class T> struct tuple_size<volatile T>;
    template<class T> struct tuple_size<const volatile T>;

    template<size_t I, class T> struct tuple_element<I, volatile T>;
    template<size_t I, class T> struct tuple_element<I, const volatile T>;
}
In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

**D.20 Variant**

The header `<variant>` (22.6.2) has the following additions:

```cpp
namespace std {
    template<class T> struct variant_size<volatile T>;
    template<class T> struct variant_size<const volatile T>;

    template<size_t I, class T> struct variant_alternative<I, volatile T>;
    template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}
```

Let VS denote `variant_size<T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the `Cpp17UnaryTypeTrait` requirements with a base characteristic of `integral_constant<size_t, VS::value>`.

```cpp
template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;
```

Let VA denote `variant_alternative<I, T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the `Cpp17TransformationTrait` requirements with a member typedef `type` that names the following type:

- for the first specialization, `add_volatile_t<VA::type>`, and
- for the second specialization, `add_cv_t<VA::type>`.

**D.21 Deprecated iterator class template**

The header `<iterator>` (25.2) has the following addition:

```cpp
namespace std {
    template<class Category, class T, class Distance = ptrdiff_t, class Pointer = T*, class Reference = T&>
    struct iterator {
        using iterator_category = Category;
        using value_type = T;
        using difference_type = Distance;
        using pointer = Pointer;
        using reference = Reference;
    };
}
```

The `iterator` template may be used as a base class to ease the definition of required types for new iterators.

**D.22 Deprecated move_iterator access**

The following member is declared in addition to those members specified in 25.5.4.6:
namespace std {
    template<class Iterator>
    class move_iterator {
    public:
        constexpr pointer operator->() const;
    }
}

constexpr pointer operator->() const;

2

Returns: current.

D.23 Deprecated shared_ptr atomic access [depr.util.smartptr.shared.atomic]

1 The header <memory> (20.2.2) has the following additions:

namespace std {
    template<class T>
    bool atomic_is_lock_free(const shared_ptr<T>* p);

    template<class T>
    shared_ptr<T> atomic_load(const shared_ptr<T>* p);
    template<class T>
    shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

    template<class T>
    void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
    template<class T>
    void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    template<class T>
    shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
    template<class T>
    shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    template<class T>
    bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
    template<class T>
    bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
    template<class T>
    bool atomic_compare_exchange_weak_explicit(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w, memory_order success, memory_order failure);
    template<class T>
    bool atomic_compare_exchange_strong_explicit(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w, memory_order success, memory_order failure);
}

2 Concurrent access to a shared_ptr object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

3 The meaning of the arguments of type memory_order is explained in 33.5.4.

    template<class T>
    bool atomic_is_lock_free(const shared_ptr<T>* p);

4 Preconditions: p is not null.

5 Returns: true if atomic access to \*p is lock-free, false otherwise.

6 Throws: Nothing.

    template<class T>
    shared_ptr<T> atomic_load(const shared_ptr<T>* p);

7 Preconditions: p is not null.

8 Returns: atomic_load_explicit(p, memory_order::seq_cst).

9 Throws: Nothing.
template<class T> shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

    Preconditions: p is not null. mo is neither memory_order::release nor memory_order::acq_rel.
    Returns: *p.
    Throws: Nothing.

template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);

    Preconditions: p is not null.
    Effects: As if by atomic_store_explicit(p, r, memory_order::seq_cst).
    Throws: Nothing.

template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    Preconditions: p is not null. mo is neither memory_order::acquire nor memory_order::acq_rel.
    Effects: As if by p->swap(r).
    Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);

    Preconditions: p is not null.
    Returns: atomic_exchange_explicit(p, r, memory_order::seq_cst).
    Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    Preconditions: p is not null.
    Effects: As if by p->swap(r).
    Returns: The previous value of *p.
    Throws: Nothing.

template<class T>
bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

    Preconditions: p is not null and v is not null.
    Returns: atomic_compare_exchange_weak_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)
    Throws: Nothing.

template<class T>
bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

    Returns: atomic_compare_exchange_strong_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)

template<class T>
bool atomic_compare_exchange_weak_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

template<class T>
bool atomic_compare_exchange_strong_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

    Preconditions: p is not null and v is not null. The failure argument is neither memory_order::release
    nor memory_order::acq_rel.
    Effects: If *p is equivalent to *v, assigns w to *p and has synchronization semantics corresponding to
    the value of success, otherwise assigns *p to *v and has synchronization semantics corresponding to
    the value of failure.
Returns: true if \*p was equivalent to \*v, false otherwise.

Throws: Nothing.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and share ownership. The weak form may fail spuriously. See 33.5.8.2.

D.24 Deprecated basic_string capacity

The following member is declared in addition to those members specified in 23.4.3.5:

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_string {
    public:
        void reserve();
    }
}
```

§ D.24 1997

Effects: After this call, capacity() has an unspecified value greater than or equal to size().

[Note 1: This is a non-binding shrink to fit request. — end note]
D.26.3 Requirements

For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:

1. **Elem** is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.
2. **Maxcode** is the largest wide-character code that the facet will read or write without reporting a conversion error.
3. If `(Mode & consume_header)`, the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.
4. If `(Mode & generate_header)`, the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.
5. If `(Mode & little_endian)`, the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.
6. UCS-2 is the same encoding as UTF-16, except that it encodes scalar values in the range U+0000–U+FFFF (Basic Multilingual Plane) only.

For the facet `codecvt_utf8`:

1. The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the size of **Elem**).
2. Endianness shall not affect how multibyte sequences are read or written.
3. The multibyte sequences may be written as either a text or a binary file.

For the facet `codecvt_utf16`:

1. The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the size of **Elem**).
2. Multibyte sequences shall be read or written according to the **Mode** flag, as set out above.
3. The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.

For the facet `codecvt_utf8_utf16`:

1. The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.
2. Endianness shall not affect how multibyte sequences are read or written.
3. The multibyte sequences may be written as either a text or a binary file.

D.27 Deprecated convenience conversion interfaces

D.27.1 General

The header `<locale>` (30.2) has the following additions:

```cpp
namespace std {
    template<class Codecvt, class Elem = wchar_t, class WideAlloc = allocator<Elem>,
             class ByteAlloc = allocator<char>>
    class wstring_convert;

    template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
    class wbuffer_convert;
}
```
D.27.2 Class template wstring_convert

Class template wstring_convert performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template codecvt) to perform the conversions, without affecting any streams or locales.

[Example 1: If you want to use the code conversion facet codecvt_utf8 to output to cout a UTF-8 multibyte sequence corresponding to a wide string, but you don’t want to alter the locale for cout, you can write something like:

```cpp
std::wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;
```

—end example]

namespace std {
    template<class Codecvt, class Elem = wchar_t,
       class WideAlloc = allocator<Elem>,
       class ByteAlloc = allocator<char>>
    class wstring_convert {
        public:
            using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
            using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
            using state_type = typename Codecvt::state_type;
            using int_type = typename wide_string::traits_type::int_type;

            wstring_convert() : wstring_convert(new Codecvt) {}  
            explicit wstring_convert(Codecvt* pcvt);
            wstring_convert(Codecvt* pcvt, state_type state);
            explicit wstring_convert(const byte_string& byte_err,
                                        const wide_string& wide_err = wide_string());
            ~wstring_convert();

            wstring_convert(const wstring_convert&) = delete;
            wstring_convert& operator=(const wstring_convert&) = delete;

            wide_string from_bytes(char byte);
            wide_string from_bytes(const char* ptr);
            wide_string from_bytes(const byte_string& str);
            wide_string from_bytes(const char* first, const char* last);

            byte_string to_bytes(Elem wchar);
            byte_string to_bytes(const Elem* wptr);
            byte_string to_bytes(const wide_string& wstr);
            byte_string to_bytes(const Elem* first, const Elem* last);

            size_t converted() const noexcept;
            state_type state() const;

        private:
            byte_string byte_err_string;    // exposition only
            wide_string wide_err_string;    // exposition only
            Codecvt* cvtptr;               // exposition only
            state_type cvtstate;           // exposition only
            size_t cvtcount;               // exposition only
        }
    }

The class template describes an object that controls conversions between wide string objects of class basic_string<Elem, char_traits<Elem>, WideAlloc> and byte string objects of class basic_string<char, char_traits<char>, ByteAlloc>. The class template defines the types wide_string and byte_string as synonyms for these two types. Conversion between a sequence of Elem values (stored in a wide_string object) and multibyte sequences (stored in a byte_string object) is performed by an object of class Codecvt, which meets the requirements of the standard code-conversion facet codecvt<Elem, char, mbstate_t>.

An object of this class template stores:

(3.1) — byte_err_string — a byte string to display on errors
(3.2)  — **wide_err_string** — a wide string to display on errors

(3.3)  — **cvtptr** — a pointer to the allocated conversion object (which is freed when the `wstring_convert` object is destroyed)

(3.4)  — **cvtstate** — a conversion state object

(3.5)  — **cvtcount** — a conversion count

```cpp
size_t converted() const noexcept;
```

Returns: `cvtcount`.

```cpp
wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);
```

Effects: The first member function converts the single-element sequence `byte` to a wide string. The second member function converts the null-terminated sequence beginning at `ptr` to a wide string. The third member function converts the sequence stored in `str` to a wide string. The fourth member function converts the sequence defined by the range `[first, last)` to a wide string.

In all cases:

(6.1)  — If the `cvtstate` object was not constructed with an explicit value, it is set to its default value (the initial conversion state) before the conversion begins. Otherwise it is left unchanged.

(6.2)  — The number of input elements successfully converted is stored in `cvtcount`.

Returns: If no conversion error occurs, the member function returns the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function returns the wide-error string. Otherwise, the member function throws an object of class `range_error`.

```cpp
state_type state() const;
```

Returns: `cvtstate`.

```cpp
byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);
```

Effects: The first member function converts the single-element sequence `wchar` to a byte string. The second member function converts the null-terminated sequence beginning at `wptr` to a byte string. The third member function converts the sequence stored in `wstr` to a byte string. The fourth member function converts the sequence defined by the range `[first, last)` to a byte string.

In all cases:

(10.1)  — If the `cvtstate` object was not constructed with an explicit value, it is set to its default value (the initial conversion state) before the conversion begins. Otherwise it is left unchanged.

(10.2)  — The number of input elements successfully converted is stored in `cvtcount`.

Returns: If no conversion error occurs, the member function returns the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function returns the byte-error string. Otherwise, the member function throws an object of class `range_error`.

```cpp
explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err, const wide_string& wide_err = wide_string());
```

Preconditions: For the first and second constructors, `pcvt` is not null.

Effects: The first constructor stores `pcvt` in `cvtptr` and default values in `cvtstate`, `byte_err_string`, and `wide_err_string`. The second constructor stores `pcvt` in `cvtptr`, state in `cvtstate`, and default values in `byte_err_string` and `wide_err_string`; moreover the stored state is retained between calls to `from_bytes` and `to_bytes`. The third constructor stores new `Codecvt` in `cvtptr`, state_type() in `cvtstate`, `byte_err` in `byte_err_string`, and `wide_err` in `wide_err_string`. 

§ D.27.2 2000
D.27.3 Class template wbuffer_convert

Class template `wbuffer_convert` looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template `wstring_convert`, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

```cpp
namespace std {
    template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
    class wbuffer_convert : public basic_streambuf<Elem, Tr> {
        public:
            using state_type = typename Codecvt::state_type;

            wbuffer_convert() : wbuffer_convert(nullptr) {}  // exposition only
            explicit wbuffer_convert(streambuf* bytebuf, Codecvt* pcvt = new Codecvt, state_type state = state_type());
            ~wbuffer_convert();
            wbuffer_convert(const wbuffer_convert&) = delete;
            wbuffer_convert& operator=(const wbuffer_convert&) = delete;

            streambuf* rdbuf() const;  // exposition only
            streambuf* rdbuf(streambuf* bytebuf);
            state_type state() const;  // exposition only

        private:
            streambuf* bufptr;  // exposition only
            Codecvt* cvtptr;  // exposition only
            state_type cvtstate;  // exposition only
    };
}
```

The class template describes a stream buffer that controls the transmission of elements of type `Elem`, whose character traits are described by the class `Tr`, to and from a byte stream buffer of type `streambuf`. Conversion between a sequence of `Elem` values and multibyte sequences is performed by an object of class `Codecvt`, which shall meet the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`. An object of this class template stores:

(3.1) — `bufptr` — a pointer to its underlying byte stream buffer

(3.2) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wbuffer_convert` object is destroyed)

(3.3) — `cvtstate` — a conversion state object

```cpp
state_type state() const;
```

Returns: `cvtstate`.

```cpp
streambuf* rdbuf() const;
```

Returns: `bufptr`.

```cpp
streambuf* rdbuf(streambuf* bytebuf);
```

Effects: Stores `bytebuf` in `bufptr`.

Returns: The previous value of `bufptr`.

```cpp
explicit wbuffer_convert(
    streambuf* bytebuf,
    Codecvt* pcvt = new Codecvt,
```
state_type state = state_type();

Preconditions: pcvt is not null.

Effects: The constructor constructs a stream buffer object, initializes bufptr to bytebuf, initializes cvtptr to pcvt, and initializes cvtstate to state.

~wbuffer_convert();

Effects: delete cvtptr.

D.28 Deprecated locale category facets

The ctype locale category includes the following facets as if they were specified in table Table 104 of 30.3.1.2.1.

- codecvt<char16_t, char, mbstate_t>
- codecvt<char32_t, char, mbstate_t>

The ctype locale category includes the following facets as if they were specified in table Table 105 of 30.3.1.2.1.

- codecvt_byname<char16_t, char, mbstate_t>
- codecvt_byname<char32_t, char, mbstate_t>

The following class template specializations are required in addition to those specified in 30.4.2.5. The specialization codecvt<char16_t, char, mbstate_t> converts between the UTF-16 and UTF-8 encoding forms, and the specialization codecvt<char32_t, char, mbstate_t> converts between the UTF-32 and UTF-8 encoding forms.

D.29 Deprecated filesystem path factory functions

The header <filesystem> (31.12.4) has the following additions:

template<class Source>
path u8path(const Source& source);

template<class InputIterator>
path u8path(InputIterator first, InputIterator last);

Mandates: The value type of Source and InputIterator is char or char8_t.

Preconditions: The source and [first, last) sequences are UTF-8 encoded. Source meets the requirements specified in 31.12.6.4.

Returns:

(4.1) — If path::value_type is char and the current native narrow encoding (31.12.6.3.2) is UTF-8, return path(source) or path(first, last); otherwise,

(4.2) — if path::value_type is wchar_t and the native wide encoding is UTF-16, or if path::value_type is char16_t or char32_t, convert source or [first, last) to a temporary, tmp, of type path::string_type and return path(tmp); otherwise,

(4.3) — convert source or [first, last) to a temporary, tmp, of type u32string and return path(tmp).

Remarks: Argument format conversion (31.12.6.3.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

[Example 1: A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs.

—end example]

[Note 1: The example above is representative of a historical use of filesystem::u8path. To indicate a UTF-8 encoding, passing a std::u8string to path’s constructor is preferred as it is consistent with path’s handling of other encodings. — end note]

§ D.29 2002
D.30 Deprecated atomic operations

D.30.1 General

The header `<atomic>` (33.5.2) has the following additions.

```cpp
namespace std {
  template<class T>
  void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
  template<class T>
  void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;

  #define ATOMIC_VAR_INIT(value) see below
}
```

D.30.2 Volatile access

If an atomic (33.5.8) specialization has one of the following overloads, then that overload participates in overload resolution even if `atomic<T>::is_always_lock_free` is false:

- `void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `T operator=(T desired) volatile noexcept;`
- `T load(memory_order order = memory_order::seq_cst) const volatile noexcept;`
- `T operator T() const volatile noexcept;`
- `T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `bool compare_exchange_weak(T& expected, T desired, memory_order success, memory_order failure) volatile noexcept;`
- `bool compare_exchange_strong(T& expected, T desired, memory_order success, memory_order failure) volatile noexcept;`
- `bool compare_exchange_weak(T& expected, T desired, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `bool compare_exchange_strong(T& expected, T desired, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;`
- `T operator=(T operand) volatile noexcept;`
- `T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;`

D.30.3 Non-member functions

```cpp
template<class T>
void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

Effects: Equivalent to: `atomic_store_explicit(object, desired, memory_order::relaxed);`

D.30.4 Operations on atomic types

```cpp
#define ATOMIC_VAR_INIT(value) see below
```

The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with `value`.

[Note 1: This operation possibly needs to initialize locks. — end note]

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

[Example 1:
  `atomic<int> v = ATOMIC_VAR_INIT(5);`
  — end example]
Annex E  (informative)
Conformance with UAX #31

E.1 General

This Annex describes the choices made in application of UAX #31 (“Unicode Identifier and Pattern Syntax”) to C++ in terms of the requirements from UAX #31 and how they do or do not apply to C++. In terms of UAX #31, C++ conforms by meeting the requirements R1 “Default Identifiers” and R4 “Equivalent Normalized Identifiers”. The other requirements, also listed below, are either alternatives not taken or do not apply to C++.

E.2 R1 Default identifiers

E.2.1 General

UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

<Identifier> := <Start> <Continue>* (<Medial> <Continue>)*

where <Start> has the XID_Start property, <Continue> has the XID_Continue property, and <Medial> is a list of characters permitted between continue characters. For C++ we add the character u+005F LOW LINE, or _, to the set of permitted <Start> characters, the <Medial> set is empty, and the <Continue> characters are unmodified. In the grammar used in UAX #31, this is

<Identifier> := <Start> <Continue>*
<Start> := XID_Start + u+005F
<Continue> := <Start> + XID_Continue

This is described in the C++ grammar in 5.10, where identifier is formed from identifier-start or identifier followed by identifier-continue.

E.2.2 R1a Restricted format characters

If an implementation of UAX #31 wishes to allow format characters such as u+200D ZERO WIDTH JOINER or u+200C ZERO WIDTH NON-JOINER it must define a profile allowing them, or describe precisely which combinations are permitted.

C++ does not allow format characters in identifiers, so this does not apply.

E.2.3 R1b Stable identifiers

An implementation of UAX #31 may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.

C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the XID_Start and XID_Continue properties.

E.3 R2 Immutable identifiers

An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.

C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

E.4 R3 Pattern_White_Space and Pattern_Syntax characters

UAX #31 describes how formal languages such as computer languages should describe and implement their use of whitespace and syntactically significant characters during the processes of lexing and parsing.

C++ does not claim conformance with this requirement.
E.5  R4 Equivalent normalized identifiers

1 UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.
2 C++ requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in 5.10.

E.6  R5 Equivalent case-insensitive identifiers

1 C++ considers case to be significant in identifier comparison, and does not do any case folding. This requirement does not apply to C++.

E.7  R6 Filtered normalized identifiers

1 If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.
2 C++ does not make any such exclusions.

E.8  R7 Filtered case-insensitive identifiers

1 C++ identifiers are case sensitive, and therefore this requirement does not apply.

E.9  R8 Hashtag identifiers

1 There are no hashtags in C++, so this requirement does not apply.

Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

# Index of library concepts

The bold page number for each entry is the page where the concept is defined. Other page numbers refer to pages where the concept is mentioned in the general text. Concepts whose name appears in italics are for exposition only.

Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

#pragma, 477
additional execution policies supported by parallel algorithms, 805, 1302
additional file_type enumerators for file systems supporting additional types of file, 1761
additional formats for time_get::do_get_date, 1626
additional supported forms of preprocessing directive, 465
algorithms for producing the standard random number distributions, 1451
alignment, 71
alignment additional values, 71
alignment of bit-fields within a class object, 293
allocation of bit-fields within a class object, 293
any use of an invalid pointer other than to perform indirection or deallocate, 68
argument values to construct ios_base::failure, 1661
assignability of placeholder objects, 787
barrier phrase completion without wait, 1901
behavior of iostream classes when traits::pos_type is not streampos or when traits::off_type is not streamoff, 1644
behavior of non-standard attributes, 252
behavior of strstreambuf::setbuf, 1989
bits in a byte, 61
character encoding scheme of the environment, 1638
choice of larger or smaller value of floating-point-literal, 26
code unit sequence for conditional-escape-sequence, 29
column value of source_location::current, 540
conversions between pointers and integers, 132
converting function pointer to object pointer and vice versa, 132
default configuration of a pool, 649
default next_buffer_size for a monotonic_buffer_resource, 650
default number of buckets in unordered_map, 982
default number of buckets in unordered_multimap, 989, 990
default number of buckets in unordered_multiset, 1000
default number of buckets in unordered_set, 994, 995
default value for least_max_value template parameter of counting_semaphore, 1898
defining main in freestanding environment, 91
definition and meaning of __STDC__, 480, 1978
definition and meaning of __STDC_VERSION__, 480
definition of NULL, 514, 1979
derived type for typeid, 129
determination of kind of input file, 13
diagnostic message, 4
dynamic initialization of static inline variables before main, 93
dynamic initialization of static variables before main, 93
dynamic initialization of thread-local variables before entry, 93
effect of calling associated Laguerre polynomials with n >= 128 or m >= 128, 1499
effect of calling associated Legendre polynomials with l >= 128, 1499
effect of calling basic_filebuf::setbuf with nonzero arguments, 1728
effect of calling basic_filebuf::sync when a get area exists, 1728
effect of calling basic_streambuf::setbuf with nonzero arguments, 1706
effect of calling cylindrical Bessel functions of the first kind with nu >= 128, 1500
effect of calling cylindrical Neumann functions with nu >= 128, 1501
effect of calling Hermite polynomials with n >= 128, 1502
effect of calling ios_base::sync_with_stdio after any input or output operation on standard streams, 1655
effect of calling irregular modified cylindrical Bessel functions with nu >= 128, 1501
effect of calling Laguerre polynomials with n >= 128, 1502
effect of calling Legendre polynomials with l >= 128, 1502
effect of calling regular modified cylindrical Bessel functions with nu >= 128, 1500
effect of calling spherical associated Legendre functions with l >= 128, 1503
effect of calling spherical Bessel functions with n >= 128, 1503
effect of calling spherical Neumann functions with \( n \geq 128, 1504 \)
effect of **conditional-escape-sequence** on encoding state, 29
effect of `filesystem::copy`, 1774
effect on C locale of calling `locale::global`, 1603
encoding assumption for `format` width computation, 814
**error_category** for errors originating outside the operating system, 511
exception type when `random_device` constructor fails, 1449
exception type when `random_device::operator()` fails, 1449
exceptions thrown by standard library functions that have a potentially-throwing exception specification, 511
exit status, 530
extended signed integer types, 77
file type of the file argument of `filesystem::status`, 1784
floating-point conversion subrank, 83
formatted character sequence generated by `time_put::do_put` in C locale, 1628
forward progress guarantees for implicit threads of parallel algorithms (if not defined for `thread`), 1301
growth factor for `monotonic_buffer_resource`, 650, 651
headers for freestanding implementation, 492
how `random_device::operator()` generates values, 1449
how `text_encoding` objects are determined to be representative of a character encoding scheme, 1637
how the set of importable headers is determined, 263
interactive device, 11
interpretation of the path character sequence with `format path::auto_format`, 1761
largest supported value to configure the largest allocation satisfied directly by a pool, 648
largest supported value to configure the maximum number of blocks to replenish a pool, 648
last enumerator of `launch`, 1903
linkage of `main`, 91
linkage of names from C standard library, 493
linkage of objects between C++ and other languages, 250
locale names, 1601
locales with Unicode support for chrono types, 1587

Index of impl.-def. behavior

l-value-to-r-value conversion of an invalid pointer value, 100
manner of search for included source file, 469
mapping from name to catalog when calling `messages::do_open`, 1634
mapping header name to header or external source file, 19
mapping input source file characters to translation character set, 1960
mapping of pointer to integer, 131
mapping physical source file characters to translation character set, 13
mapping to message when calling `messages::do_get`, 1635
maximum depth of recursive template instantiations, 426
maximum size of an allocated object, 139, 536
meaning of `,`, `/`, `/*`, or `//` in a q-char-sequence or an h-char-sequence, 19
meaning of `asm` declaration, 248
meaning of attribute declaration, 177
meaning of dot-dot in `root-directory`, 1748
nesting limit for #include directives, 469
NTCTS in `basic_ostream<charT, traits>& operator<<(nullptr_t)`, 1691
number of placeholders for bind expressions, 771, 787
number of threads in a program under a freestanding implementation, 86
operating system on which implementation depends, 1740
`operator<<` for large extended floating-point types, 1690
`operator>>` for large extended floating-point types, 1678
ordinary and wide literal encodings, 16
parameters to `main`, 91
passing argument of class type through ellipsis, 125
presence and meaning of `native_handle_type` and `native_handle`, 1823
presence and value of `__STDC_ISO_10646__`, 480
rank of extended signed integer type, 82
representation of floating-point types, 79
required alignment for `atomic_ref` type’s operations, 1846, 1849–1851
resource limits on a message catalog, 1635
result of `filesystem::file_size`, 1778
result of inexact floating-point conversion, 102, 131
resuming a coroutine on a different execution agent, 557
return type of `cartesian_product_view::size`, 1288
return value of `bad_alloc::what`, 536
return value of bad_any_cast::what, 738
return value of bad_array_new_length::what, 536
return value of bad_cast::what, 539
return value of bad_exception::what, 542
return value of bad_function_call::what, 788
return value of bad_optional_access::what, 723
return value of bad_typeid::what, 539
return value of bad_variant_access::what, 737
return value of bad_weak_ptr::what, 623
return value of char_traits<char16_t>::eof, 844
return value of char_traits<char32_t>::eof, 844
return value of char_traits<char8_t>::eof, 843
return value of exception::what, 542
return value of source_location::current, 540
return value of type_info::name(), 538

search locations for "", 469
search locations for <> header, 468
semantics of an access through a volatile glvalue, 186

semantics of linkage specifiers, 248
semantics of parallel algorithms invoked with
implementation-defined execution policies, 1302

semantics of

stacktrace_entry::native_handle, 591

semantics of

token parameter and default token
value used by random_device

constructors, 1449

sequence of places searched for a header, 468

set of aliases of a known registered character
encoding, 1637

set of character types that iostreams templates
can be instantiated for, 1600, 1644

set of integer-class types, 1096

signedness of char, 188

sizeof applied to fundamental types other than
char, signed char, and unsigned
char, 137

stack unwinding before invocation of
std::terminate, 459, 463

stacktrace_entry::native_handle_type, 590

startup and termination in freestanding
environment, 91

strict total order over pointer values, 5

string resulting from __func__, 229

support for extended alignments, 71

support for module-import-declarations with
non-C++ language linkage, 249

supported input files, 13

supported multibyte character encoding rules, 843

supported root-names in addition to any operating
system dependent root-names, 1748

text of __DATE__ when date of translation is not
available, 477

text of __TIME__ when time of translation is not
available, 478

threads and program points at which deferred
dynamic initialization is performed, 93

type of a directory-like file, 1768, 1770

type of array::const_iterator, 927

type of array::iterator, 927

type of basic_stacktrace::const_iterator, 591

186

type of basic_stacktrace::difference_type, 591

type of basic_stacktrace::size_type, 591

type of basic_string::const_iterator, 859

type of basic_string::iterator, 859

type of basic_string_view::const_iterator, 846, 849

type of default_random_engine, 1448

type of deque::const_iterator, 929

type of deque::difference_type, 929

type of deque::iterator, 929

type of deque::size_type, 929

type of regex_constants::error_type, 1797
Index of impl.-def. behavior

- value of bit-field that cannot represent assigned value, 54
- value of result of inexact integer to floating-point conversion, 81
- value representation of pointer types, 81
- units of various ATOMIC_..._LOCK_FREE macros, 1527
- whether <cfenv> functions can be used to manage floating-point status, 1423
- whether a freestanding deleted function is a freestanding item or a deleted function, 489
- whether a given atomic type’s operations are always lock free, 1853, 1854, 1857, 1859, 1861, 1863, 1866
- whether a given atomic type’s operations are always lock free, 1846, 1849–1851
- whether basic_spanbuf’s move source is empty after a move, 1717
- whether freestanding default replaceable global allocation functions satisfy required behavior, 532
- whether functions from Annex K of the C standard library are declared when C++ headers are included, 491
- whether locale object is global or per-thread, 1599
- whether pragma FENV_ACCESS is supported, 1423
- whether rand may introduce a data race, 1472

2169
whether sequence pointers are copied by

    basic_filebuf move constructor, 1724

whether sequence pointers are copied by

    basic_stringbuf move constructor, 1702

whether sequence pointers are initialized to null

pointers, 1701

whether source file inclusion of importable header

is replaced with import directive, 469

whether source of translation units must be

available to locate template definitions, 14

whether stack is unwound before invoking the

function std::terminate when a

noexcept specification is violated, 463

whether the implementation is hosted or

freestanding, 492

whether the lifetime of a parameter ends when the
callee returns or at the end of the

enclosing full-expression, 124

whether the sources for module units and header

units on which the current translation

unit has an interface dependency are

required to be available during

translation, 14

whether the thread that executes main and the

threads created by std::thread or

std::jthread provide concurrent

forward progress guarantees, 90

whether time_get::do_get_year accepts
two-digit year numbers, 1626

whether values are rounded or truncated to the

required precision when converting

between time_t values and time_point

objects, 1532

which functions in the C++ standard library may

be recursively reentered, 509

which non-standard-layout objects containing no
data are considered empty, 63

which scalar types have unique object

representations, 672

width of integral type, 78
